The Stirling Project: High Tech Engine Research Heats Up

Ω OMEGA HAS IT ALL!

Thousands of Temperature Measurement and Control Devices!
"OFF-THE-SHELF" FOR FAST DELIVERY!

Solid State Temperature Controller **NEW!**

The CN310 compact temperature controller combines versatility and economy with precision temperature control. Available with either J, K, T or RTD input, the CN310 features a large 3-1/2 digit LED display with 1% resolution. The proportional bandwidth can be adjusted by the user, to provide precise proportional or on-off control.

To Order, Call 1-800-TC-OMEGA In CT (203) 359-1660

Hand Held Thermometers **NEW!**

The HH81 and HH82 allow users to measure J and K thermocouples, with either single or dual inputs. Standard features include Display Hold, Min/Max, relative difference, units (°F/°C) and autoranging (0.1/1 degree). The HH82, with dual channels, lets you measure two different inputs and the difference between them.

High accuracy and a wide variety of features are built in to every HH81 and HH82, to combine economy with functionality.

The Ultimate Panel Meter

The DP10 series indicators are 1/8 DIN panel meters with functions and capabilities never seen before in a meter of it's size. Built-in features let the user: select the input, choosing from thermocouple, RTD, thermistor, voltage, current or resistance; scale the input with built-in math, including algebra, log and trig functions; drive analog and RS-232-C outputs; store max/min readings; and drive four alarm/control outputs.

NEW!

Microprocessor-Based Temperature/Humidity Recorder

The CT485 is a completely self-contained Temperature/humidity recorder. In addition to a large 8" chart, the CT485 features a large LCD display that can indicate temperature and humidity as well as time. This rugged unit has max/min storage capabilities and may be programmed for either 1, 7 or 32 day chart operation.

The complex world of microprocessor development just got simpler.

As the challenges of developing and debugging embedded microprocessor designs becomes more and more complex, you need the best development tools possible.

And nobody offers you higher reliability, better performance or a quicker way to develop and debug your 8, 16 or 32-bit systems than Applied Microsystems.

Our emulators, for example, can be controlled from the host computer you work with (VAX, Sun, Apollo, IBM PC or compatible). Your target system will run exactly as if its microprocessor were in place. And you'll get a clear picture of your design and how it interfaces with interrupts, clocks and the flow of software.

Our emulators are designed to work with easy-to-use VALIDATE software to give you powerful source level or symbolic debugging capabilities. You also get our powerful Event Monitor System, a hierarchical, real-time breakpoint and triggering system.

The list of benefits goes on and on; but the end result is a faster, easier and more accurate approach to developing, debugging and integrating your design.

To find out more, write Applied Microsystems Corporation, P.O. Box 97002, Redmond, Washington, USA 98073-9702. Or call (800) 426-3925, in WA call (206) 882-2000.

In Europe contact Applied Microsystems Corporation Ltd., Chiltern Court, High Street, Wendover, Aylesbury, Bucks, HP22 6EP, United Kingdom. Telephone 44(0)-296-625462. AMC-230

High-performance 8, 16 and 32-bit emulation.

Software development tools, including source and symbolic level debuggers.

Motorola, Intel, Zilog and Hitachi microprocessor support.

Artisan Integrated Board The New

Why are so many test engineers in production and R&D welcoming the new Artisan A7000 full range tester?

Simply put, it's the most versatile tester you can use and, when you factor in its amazing simplicity, probably the least expensive.

Artisan's A7000 offers easy configurability for prototype test, the speed and ease of use required in full scale

Defines Functional Test. A7000.

production and straightforward fault reporting necessary for field service debug. Different problems, different environments, different skill levels—the same tester.

The A7000 speaks in a language you'll understand. Menus and function keys handle all test preparation, execution, and evaluation operations. The system guides you through every step of testing.

The evaluation of test results, fault reporting, and documentation are taken care of automatically.

The price? A very affordable \$45,000. Low enough to pay for itself in a matter of months.

Training? One on one, at your site, and on your board.

Service? If you have a problem with our

product, it's our problem. We'll make sure that you're up and running within 24 hours.

Artisan's A7000 Integrated Test System. The first tester built to be your *only* tester.

Call for more information or a personal demonstration: (203) 871-7322.

A full-featured Optical Power Meter for half the price!*

Consider these features:

- 0.1 picowatt/-100 dBm sensitivity with 0.1 dB resolution
 - Built-in wavelength compensation at 10 nm intervals over the entire spectrum with high accuracy, NBS-traceable calibration
 - Choice of standard or *new* UV-enhanced silicon detectors or IR germanium detector
 - Auxiliary bar-graph analog backlit display and linear, log (dBm, dB) and ratio readout modes with background nulling function
 - External 0-2 volt analog output
- Options include rechargeable battery operation, fiberoptic adaptors, and IEEE-488 interface.

*Until now, these features were only available in meters that cost over twice as much as our popular Model 835 Digital Pico-Watt Power Meter.

For detailed information about this new product and other power meters, including measurement capabilities of up to 1 kilowatt, call or send for your free copy of the Newport Catalog.

FREE Advanced Math Applications Pack

when you buy MathCAD 2.0
between August 1 and
October 15, 1988.

Your pad or ours?

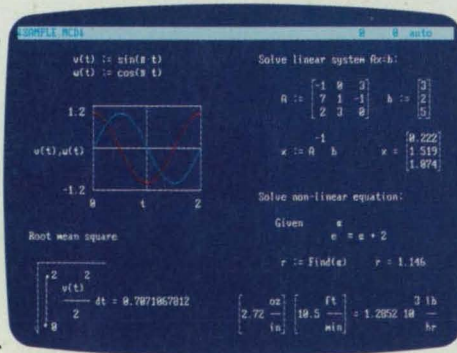

If you perform calculations, the answer is obvious.

MathCAD 2.0.

It's everything you appreciate about working on a scratchpad—simple, free-form math—and more. More speed. More accuracy. More flexibility.

Just define your variables and enter your formulas anywhere on the screen. MathCAD formats your equations as they're typed. Instantly calculates the results. And displays them exactly as you're used to seeing them—in real math notation, as numbers, tables or graphs.

MathCAD is more than an equation solver. Like a scratchpad, it allows you to add

text anywhere to support your work, and see and record every step. You can try an unlimited number of what-ifs. And print your entire calculation as an integrated document that anyone can understand.

Plus, MathCAD is loaded with powerful

built-in features. In addition to the usual trigonometric and exponential functions, it includes built-in statistical functions, cubic splines, Fourier transforms, and more. It also handles complex numbers and unit conversions in a completely transparent way.

Yet, MathCAD is so easy to learn, you'll be using its full power an hour after you begin.

What more could you ask for? How about the new **Advanced Math Applications Pack**? A \$55 value, it's yours **free** when you purchase MathCAD between August 1 and October 15, 1988. The Advanced Math Pack includes a custom binder, software and documentation for 16 advanced applications such as:

- Runge-Kutta Solution of First Order Differential Equation
- Solution of Second-Order Differential Equation
- Eigenvalues and Eigenvectors of a Symmetric Matrix
- Convolution and Correlation of Sequences
- Convolutions using FFT's
- And many more!

If you're tired of doing calculations by hand or writing and debugging programs, come on over to MathCAD.

For more information contact your local dealer or call **1-800-MATHCAD, ext. 2775** (In MA: 617-577-1017, ext. 2775).

Circle Reader Action No. 637

New Product Ideas

New Product Ideas are just a few of the many innovations described in this issue of *NASA Tech Briefs* and having promising commercial applications. Each is discussed further on the referenced page in the appro-

priate section in this issue. If you are interested in developing a product from these or other NASA innovations, you can receive further technical information by requesting the TSP referenced at the end of the full-

length article or by writing the Technology Utilization Office of the sponsoring NASA center (see page 18). NASA's patent-licensing program to encourage commercial development is described on page 18.

Contactless Coupling for Power and Data

An experimental flat-plate coupling transmits digital data signals and electrical power across a small gap between two modules. Unlike multiple-pin elec-

trical connectors, the two halves of the coupling do not have to be aligned precisely for mating and can be assembled by robots, remote manipulators, or people working in protective clothing. (See page 22).

Solid-State Single-Photon Counter

A commercial avalanche photodiode can be used to detect single photons if it is cooled to an optimum temperature and overbiased beyond its breakdown voltage. Avalanche photodiodes used in this mode offer two to three times the sensitivity of the photomultiplier tubes commonly used for photon detection. (See page 27).

Yaw Control at High Angles of Attack

In a conventional airplane, the rudder becomes ineffective when the craft is operating at a very high angle of attack. The problem is solved by the use of articulated, conformal forebody strakes. Wind-tunnel tests have confirmed the effectiveness of this arrangement at angles of attack between 10° and 70° and sideslip angles of 20°. (See page 76).

Shaping Plastic Covers Quickly and Cheaply

An inexpensive, compact fixture enables the thermal forming of custom-contoured plastic covers in only half an hour. Previously, two workers needed 12 hours to form such a cover by hand. The fixture includes an aluminum baseplate and an aluminum forming plate with an opening cut out to match the cover outline. (See page 90).

This symbol appears next to technical

briefs which describe inventions having potential commercial applications as new products. The process for developing a product from a NASA invention is described at the top of this page.

We Don't Ruggedize Our Optical Disk Drives.

We don't have to. Our drives are designed and built rugged from the start.

Tracker Features

- Rugged Base Plate Construction
- Low EMI Emissions
- High Performance Optical Head
- Shock and Vibration Levels Suitable for Avionics
- No Altitude Restrictions
- Lowest Power Consumption
- Positive Air Flow System
- High Reliability Components
- Internal Temperature Compensation

A ruggedized product is just not the same as a product that is designed and manufactured as a rugged product. Ruggedized optical disk drives are ordinary drives that have been repackaged for use in harsh environments. Cherokee doesn't buy somebody else's commercial optical drive and then put it in a rugged package. Instead, Cherokee manufactures complete, rugged optical disk drives from the ground up.

The Tracker Series drives are specifically designed, manufactured and tested for applications in rugged environments, so you know that each and every component is up to the task. Tracker Drives are the only truly rugged optical disk drives available. Call today for detailed specifications and information.

OPA111/883B

RAD-HARD & READY TO SERVE

The World's Best Op Amp Just Earned Its Stripes!

OPA111/883B combines unmatched performance and radiation hardness. Our customers tell us it could be the best military op amp available. It's based on our industry-leading monolithic *Difet*® design, and we make it fully compliant to MIL-STD-883C, Class B, on our DESC-certified lines. We hope you'll consider it for your precision military instrumentation, data acquisition, optoelectronics, and test equipment applications.

Key OPA111/883B Features

- Fully compliant MIL-STD-883C processing
- Dielectrically isolated FET design provides superior radiation hardness
- Low noise: 100% tested, $8nV/\sqrt{Hz}$ max (10kHz)
- Low bias current: 2pA max
- Low offset: 500 μV max
- Low drift: 10 $\mu V/^{\circ}C$ max
- High open-loop gain: 114dB min
- Hermetic metal TO-99 package, full -55/+125 $^{\circ}C$ MIL temp range

Mission **A**ccomplished

The Stirling Engine

NASA's High Tech Power Plant

A joint research effort between NASA and the Department of Energy has resulted in a new breed of automotive engine that delivers high miles per gallon on anything from the cheapest gasoline to kerosene or home heating oil. This revolutionary power plant, the Stirling heat engine, can be applied to cars, buses, trucks—even spacecraft.

Like standard auto engines, the Stirling burns a mixture of air and fuel to drive pistons and thereby transmit power to the wheels. The Stirling differs from conventional internal combustion engines in that it employs an external heater head, where continuous combustion of a working gas takes place, located outside the cylinders.

"The Stirling's external combustion system allows virtually any liquid or gaseous fuel to be burned without degrading performance," said Dr. William Ernst, Manager of Kinematic Programs for Mechanical Technology Inc. (MTI), NASA's prime contractor for the Stirling development project. "This is advantageous to both the engine manufacturer who could use the same design and hardware for any fuel and for the consumer who could shop for the cheapest fuel and be immune to shortages of any one type of fuel."

The Stirling design also offers environmental benefits, including reduced

exhaust emissions and lower noise levels than internal combustion engines. As part of an industry-government test program, General Motors Research Laboratories conducted emission evaluations on a first-generation, or Mod I, Stirling which was installed in an AMC Spirit and driven for over 1,000 miles. General Motors reported that the Mod I met federal emission standards with a "comfortable margin," despite the fact that the engine was operated without a catalytic converter.

Separate tests performed by MTI confirmed that a 20 decibel noise reduction can be obtained from a Stirling engine over a comparable diesel engine. "By employing a continuous combustion process, the Stirling eliminates pressure pulsations from the engine exhaust and is therefore relatively quiet," explained Dr. Ernst.

Low maintenance costs and long service life are further advantages the Stirling holds over conventional engines. The Stirling has no carburetor, spark plugs, muffler, or catalytic converter, requires minimal lubrication, and never needs an oil change. In addition, the Stirling's kinematic components are free of the contaminants found in internal combustion systems.

Though the concept for the Stirling engine dates back to the early 19th century, substantial research on this

engine cycle has occurred only in the last few decades. "For years the engineering community considered the Stirling to be a laboratory curiosity, nothing more," said Ernst. The first Stirling-based engines, produced in the Netherlands during World War II and later improved in Sweden, were slow-running machines that could not compete with the more versatile spark-ignition systems.

United States interest in the Stirling began during the oil crisis of the early 1970's, when the Environmental Protection Agency was searching for an alternative automobile engine that would conserve energy and reduce reliance on fossil fuels. In 1978, the Department of Energy initiated a program to transfer Stirling technology to the United States and assigned NASA's Lewis Research Center the task of developing the high-temperature materials and sealing techniques required to transform the external combustion concept into a practical power plant.

Lewis and its contractors developed substitute metal alloys that reduced the engine's fabrication costs by eliminating cobalt and other strategic materials. Lewis engineers also invented a high-temperature lubricant coating for the Stirling that could provide a ten percent increase in engine power. When applied to the cylinder walls, the coating allows the piston rings to be moved from a cold area at the piston's lower end to a 700°C zone on top of the piston. "A considerable

Only Math Advantage® runs the same 260 hard-math subroutines on supercomputers, minicomputers, and workstations. Including Cray™, Cyber™, IBM™ Vector Facility™, VAX™, Apollo™, Sun™, IBM PC/AT™, and more. Only Math Advantage is *optimized* for so many high-performance systems, and is so compatible.

The Math Advantage library is identical across hosts. So you can develop on a workstation and execute on a supercomputer, with no recoding. And enjoy a single, consistent user interface.

Math Advantage is optimized for both vector and parallel architectures. It's designed for high-performance applications—signal,

seismic, and image processing, simulation—where CPU time is at a premium. Development is faster too, with its ready-to-use vector operations, eigensolvers, BLAS, matrix operations, and FFTs. And it's available in FORTRAN, C, and Ada.

Now in version 3.0, Math Advantage gives you more compatibility than any other math library. It's compatible with the FPS™ and Numerix™ array processor libraries, as well as the SEG seismic subroutine standard. And, for Vector Facility users,

it complements and builds upon the content of ESSL.

Math Advantage is from the experts in high-performance development tools—Quantitative Technology Corporation. So you can count on unmatched documentation, support, and technical excellence. Over a dozen computer equipment manufacturers offering Math Advantage on their systems do just that. For more information, contact QTC at (503) 626-3081 or Telex 910 240 2827.

Circle Reader Action No. 570

We build our temperature probes *precisely* for your application.

We build our temperature probes to fit your application *precisely* from:

- 41 standard packages
- 17 standard lead styles
- 12 standard lead materials
- 9 standard thread sizes
- 11 standard connectors
- 6 standard assembly materials
- 58 standard thermistors with interchangeabilities from $\pm 0.2^\circ\text{C}$ to $\pm 0.05^\circ\text{C}$

And if none of our standard options meets your needs, we'll make a custom probe from your drawing. Send for our catalog. Or call YSI toll-free at 800 343-HELP (or 513 767-7241).

YSI Incorporated
Yellow Springs, Ohio 45387 USA

amount of power is lost in the gap between the top and bottom of the piston," explained Michael Tomazic, Stirling Project Manager for Lewis. "By installing a ring near the top of each piston dome we can seal the gap and thereby boost engine power."

A Testing Ground

Before the Stirling can be mass-produced for automobiles, it must first prove its mettle in smaller starter markets. "We're looking for markets with low production rates," said Tomazic. "That way we can gain the necessary commercial experience with less financial risk."

Potential starter market applications include engine generators, heat pumps, irrigation pumps, and solar electric units. Initial applications are likely to come in the specialty vehicle market, which is the current focus of Stirling testing. Mod I engines installed in Air Force pickup trucks and vans have logged over 18,000 urban and highway miles while operating on a variety of fuels—including unleaded gasoline, jet fuel, kerosene, and diesel fuel. Throughout these evaluations, Air Force drivers reported no differences in acceleration or response due to fuel changes.

This month NASA will begin field testing of a Mod II engine in a U.S. postal van. The Mod II, which has fewer parts and weighs less than its predecessors, should improve the van's fuel efficiency by about 28 percent—from 23.1 to 29.6 miles per gallon.

With the kinematic engine technology as a base, NASA has expanded its research into free-piston Stirling engines, which could be used to generate electricity aboard NASA's planned Space Station. The free-piston Stirling has no contacting parts and is therefore less susceptible to wear than conventional engines.

While the free-piston Stirling will require years of research before it is commercially viable, the kinematic version is "ready right now for preproduction engineering by a manufacturer," according to Ernst. "We've taken the kinematic Stirling out of the laboratory and turned it into a practical engine with realistic applications," he said. "Today there are non-technical personnel driving Stirling-powered vehicles around the country as if they were out for a ride in the family car." □

The four-cylinder Mod II Stirling features three basic engine systems: First, the external heat system converts energy in the fuel to heat flux. Next, the hot engine system contains the working gas in a closed volume to transform this heat flux into a pressure wave that acts on the pistons. Finally, the cold engine/drive system transfers piston motion to connecting rods and the reciprocating rod motion is converted to rotary motion by a crankshaft.

Pre-Register Today At Special Rates For 1988's MOST IMPORTANT INTERNATIONAL CONFERENCE AND EXPOSITION

2ND ANNUAL

SPACE

TECHNOLOGY
COMMERCE &
COMMUNICATIONS

November 1-4, 1988

George R. Brown Convention Center
Houston, Texas USA

CO-SPONSORED BY:

THE SPACE FOUNDATION AND **SPACE** MAGAZINE

THE EXHIBITS

An exciting array of international organizations will offer products and services to make space ventures a reality. The second annual **SPACE: Technology, Commerce & Communications** will build on its 1988 success with exhibits from these companies and others:

NASA, Lockheed Missiles & Space Company, McDonnell Douglas, Rockwell International, Ferranti International, General Dynamics Space Systems Division, Pilkington Electro Optics, Inc., IBM Corporation, Boeing Company, Space Industries, Hercules Aerospace Company, NASA - JSC Life Sciences Project Division, Rocketdyne, Honeywell, Inc., Dynamic Engineering, Inc., Eagle Aerospace, SPACE magazine, Butterworth Scientific Ltd., Micro Craft Inc., Engineering Cybernetics, Inc., Diversified Information Services, Inc., NASA Tech Briefs, Aerospace America, Marotta Scientific Controls, Inc., Tandem Computers Incorporated, Welcom Software Technology, Computer Sciences Corporation, Strategic Software Planning Corporation, Quality Associates, Gulton Data Systems, Houston Power & Lighting Co., Apollo Computer, Aviation Week & Space Technology, Naval Research Laboratories, Satellite Communications magazine, Applied Business Technology Corp., Manitoba Aerospace Technology, Final Frontier magazine, Government of Canada, Belgian Science Policy Office, Primavera Systems and others.

THE CONFERENCE

SPACE: Technology, Commerce & Communications will address the opportunities, risks and potential for business in space, and will feature world renowned experts discussing technology advancements, new business opportunities, and more. Sessions will offer attendees a realistic assessment of today's industry and an insight into factors that influence the direction of future programs.

- Roles of Industry and Government in Commercialization of Space
- Establishing Constituencies for Space Programs Worldwide
- Research in Space
- NASA CCDS Directors Panel
- Financing Space Ventures (full day program)
- Space Shuttles
- Industrial Platforms
- The International Space Station
- Current Space Transportation Services
- Future Space Transportation Concepts
- Commercial Launch Centers
- How to Market Services
- Legal, Regulatory and Insurance Issues
- Robotics
- Remote Sensing Information Services
- Satellite Communications: Creative Use of New Technologies

Confirmed speakers include:

- Mr. Edward Donley**, Chairman, NASA Commercial Programs Advisory Committee and Chairman of the Executive Committee of the Board of Directors of Air Products and Chemicals, Inc.
- Mr. Robert Hood**, Vice President, Aerospace Business Development, McDonnell Douglas Corporation
- Mr. Gordon Williams**, Vice President & General Manager, TRW Federal Systems
- Mr. James Rose**, Assistant Administrator for Commercial Programs, NASA HQ
- Dr. Rupert Haydn**, Managing Director, GAF, Germany
- Mr. Courtney A. Stadd**, Director, Office of Commercial Space Transportation, U.S. Dept. of Transportation
- Dr. Robert Bartholemy**, SES, Program Manager, National Aero-Space Plane Joint Program Office
- Mr. Robert Brumley**, General Counsel, U.S. Dept. of Commerce
- Mr. L.J. "Bud" Evans**, President, Center for Space and Advanced Technology
- Mr. Jean-Yves LeGall**, Conseiller Technique, French Ministry of Space
- Dr. Hans Hoffman**, President & Managing Director, Intospace, Germany
- Mr. Alain Gaubert**, Executive Manager, PROSPACE, France
- Mr. Gerald C. Musarra**, Program Counsel, U.S. Dept. of Transportation
- Mr. Peter Tambosi**, Vice President, Aerospace, Banque Nationale de Paris
- Mr. Bernard Deloffre**, Hermes Aerospatiale
- Dr. Joseph Allen**, Executive Vice President, Space Industries
- Mr. James Barrett**, President, International Technology Underwriters Corp.
- Mr. Hollister Cantus**, Assistant Administrator for External Relations, NASA HQ
- Mr. Ian Pryke**, Head, Washington Office, European Space Agency

- Dr. Peter Kleber**, Project Manager, Industrialization of Space, DFVLR, Germany
- Ms. Shellyn McCaffrey**, Associate Deputy Secretary, U.S. Dept. of Commerce
- Mr. Robert Thompson**, Vice President & General Manager, McDonnell Douglas Astronautics Company
- Mr. Peter Wood**, Consultant and Past Senior Vice President, Booz-Allen & Hamilton
- Mr. John Hannon**, Vice President & General Manager, COMSAT World Systems Division
- Dr. Frederick Henderson III**, President, The GEOSAT Committee
- Mr. Ian Parker**, Editor-in-Chief, SPACE Magazine, U. K.
- Dr. Harry Foden**, Vice President, Arthur D. Little
- Dr. Robert Bayuzick**, Director, Center for Space Processing of Engineering Materials, Vanderbilt University
- Dr. John Bossler**, Director, Center for Real-Time Satellite Mapping, Ohio State University
- Mr. David O. Wicks, Jr.**, President, Criterion Investments
- Dr. Chris Shove**, Director, Space Programs, Florida Dept. of Commerce
- Mr. Richard Nausch**, Managing Director, Marsh & McLennan Aviation
- Dr. Peter Glaser**, Vice President, Arthur D. Little
- Dr. Patrick Brown**, Group Leader, The MITRE Corporation
- Mr. Gary Miglicco**, Partner, Peat Marwick
- Mr. David Langstaff**, Senior VP and Chief Financial Officer, Space Industries
- Dr. Dennis Barnes**, Space Business Advocate, State of Virginia and Assoc. V.P. for Government Relations, University of Virginia
- Dr. Jean N. Koster**, Associate Director, Center for Low-Gravity Fluid Mechanics and Transport Phenomena, University of Colorado at Boulder
- Mr. Ankur Hajare**, MTS, The MITRE Corporation
- Dr. Otavio Durao**, Brazilian Institute for Space Research
- Dr. Ronald Giuntini**, Manager, Space Engineering, Wyle Laboratories
- Mrs. Candace Johnson**, Marketing Manager, Hans Kolbe & Co., Germany

HOW YOU CAN BENEFIT FROM NASA'S TECHNOLOGY UTILIZATION SERVICES

If you're a regular reader of TECH BRIEFS, then you're already making use of one of the low- and no-cost services provided by NASA's Technology Utilization (TU) Network. But a TECH BRIEFS subscription represents only a fraction of the technical information and applications/engineering services offered by the TU Network as a whole. In fact, when all of the components of NASA's Technology Utilization Network are considered, TECH BRIEFS represents the proverbial tip of the iceberg.

We've outlined below NASA's TU Network—named the participants, described their services, and listed the individuals you can contact for more information relating to your specific needs. We encourage you to make use of the information, access, and applications services offered by NASA's Technology Utilization Network.

How You Can Utilize NASA's Industrial Applications Centers—A nationwide network offering a broad range of technical services, including computerized access to over 100 million documents worldwide.

You can contact NASA's network of Industrial Applications Centers (IACs) for assistance in solving a specific technical problem or meeting your information needs. The "user friendly" IACs are staffed by technology transfer experts who provide computerized information retrieval from one of the world's largest banks of technical data. Nearly 500 computerized data bases, ranging from NASA's own data base to Chemical Abstracts and INSPEC, are accessible through the nine IACs located throughout the nation. The IACs also offer technical consultation services and/or linkage with other experts in the field. You can obtain more information about these services by calling or writing the nearest IAC. User fees are charged for IAC information services.

How You Can Access Technology Transfer Services At NASA Field Centers:

Technology Utilization Officers & Patent Counsels—Each NASA Field Center has a Technology Utilization Officer (TUO) and a Patent Counsel to facilitate technology transfer between NASA and the private sector.

If you need further information about new technologies presented in NASA Tech Briefs, request the Technical Support Package (TSP). If a TSP is not available, you can contact the Technology Utilization Officer at the NASA Field Center that sponsored the research. He can arrange for assistance in applying the technology by putting you in touch with the people who developed it. If you want information about the patent status of a technology or are interested in licensing a NASA invention, contact the Patent Counsel at the NASA Field Center that sponsored the research. Refer to the NASA reference number at the end of the Tech Brief.

THE CHALLENGE: "MACHINE HIGHLY COMPLEX AEROSPACE COMPONENTS WITH PRECISE REPEATABILITY. AND REDUCE COSTS SIGNIFICANTLY."

We were able to meet this challenge because at Howmet we work closely with our customer-partners. Our engineer-to-engineer approach allows us to take charge from concept through prototype to finished product and provide our customers with capabilities our competitors can't match.

ECM equipment is integrated with customer CAD/CAM data.

GREATER DESIGN FREEDOM AND COST EFFECTIVENESS.

At our New England Aircraft Products Division, in Farmington, CT, we produce airfoils up to 14" in length by electrochemical machining (ECM). As a "stress-free" process, ECM permits thinner, more complex shapes which are otherwise extremely costly or impossible to manufacture. And our CAD/CAM technology permits your design to be duplicated precisely. With no final polishing required and a low scrap rate, manufacturing costs are reduced as much as 10%.

ECM'd fan and compressor blades for P&W jet engines.

Howmet's Winsted Machining Center, in Winsted, CT, specializes in small to medium airfoils. Our state-of-the-art encapsulation system and CNC continuous dress creep feed grinders triple the removal rates while improving accuracy and throughput.

At Whitehall, MI, our Whitehall Machining Division specializes in medium to large airfoils and integral nozzles and rotors. We also run small lots and prototype work, offering fast turn time and low cost for special needs. Our creep feed grinders reduce machining time while increasing precision and flexibility.

CNC-controlled YAG laser performs cutting, welding and drilling.

IMPOSSIBLE? CHALLENGE US. At Howmet, we employ the most advanced technologies to meet the strict requirements of our customer-partners. We will work closely with you, engineer to engineer, to

These retainers plates are typical of our precision-machined hardware.

bring your product cost-effectively from prototype work into production. For more information on our machining capabilities, write our Sales Department, Howmet Corporation, 475 Steamboat Road, Greenwich, CT 06836-1960. Or phone the Sales Manager at New England Aircraft Products Division, (203) 677-1376, Whitehall Machining Division, (616) 894-5686, or Winsted Machining Center, (203) 379-3314.

Switching Voltage Regulator

Both pulsed and continuous outputs are available.

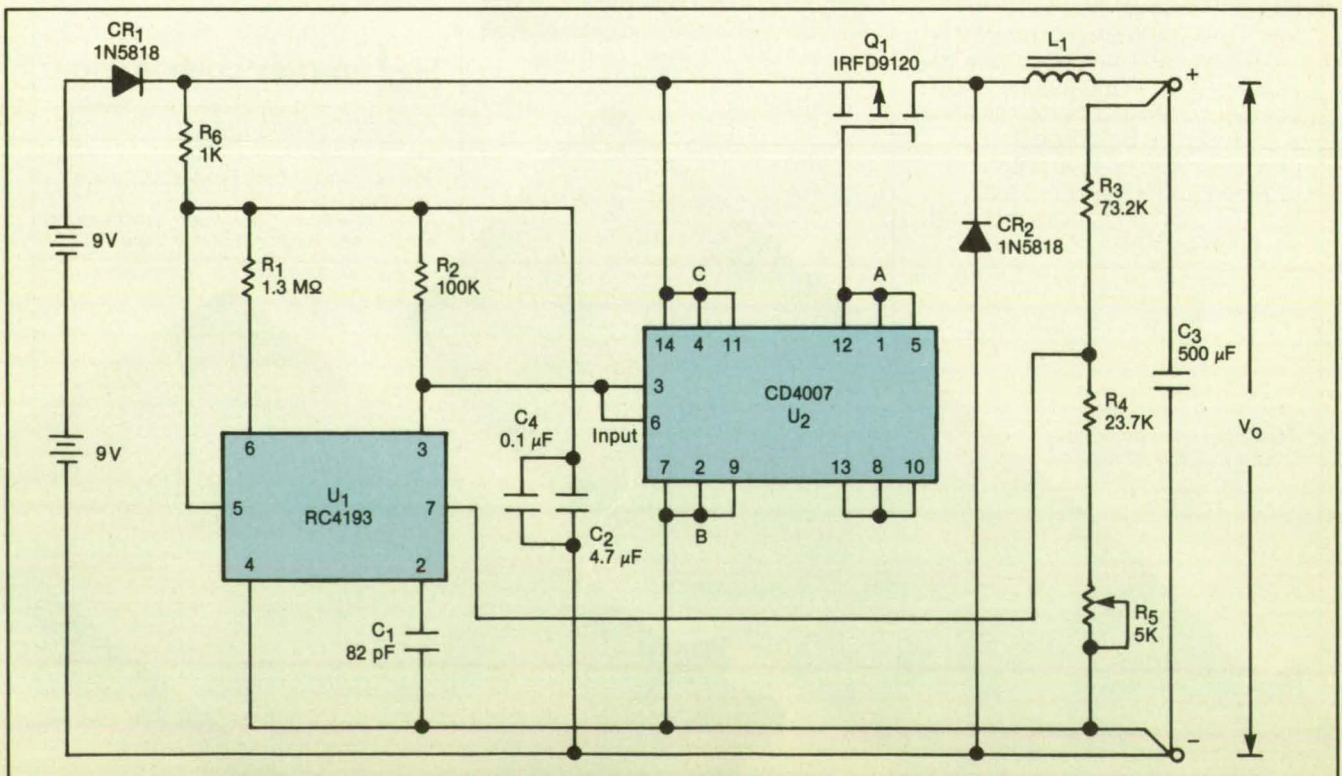

NASA's Jet Propulsion Laboratory, Pasadena, California

A switching power-supply circuit converts the input power from two 9-V batteries in series to an output of 5 Vdc regulated within 1.5 percent, either at a continuous current of 5 mA or at a current of 500 mA in 0.5-s pulses at 1-min intervals. The power supply operates for at least 100 h on a pair of batteries. It is at least 50 percent efficient at a 5-mA load and 76 percent efficient at a 500-mA load.

Figure 1. This **Simplified Schematic Diagram** illustrates the principle of operation—inductive and capacitive filtering of controlled pulses of battery voltage.

Figure 2. This **Power Supply** converts unregulated 12- to 18-Vdc input to regulated 5-Vdc output.

"The whole
of science
is nothing more
than a refinement
of everyday
thinking."

—Albert Einstein

Every day at MicroLithics our staff applies innovative engineering to leading-edge military packaging and interconnect technologies. We are committed to advance the sciences of ceramic, copper and gold multilayer thick film, and surface mount assembly. Our emphasis on imagination is resulting in cost-effective new products of extremely high reliability for demanding environments.

Put yourself a step ahead of the competition by combining your application with our creative resource. Let us help you incorporate tomorrow's interconnect technology in your system, today.

MicroLithics®

Fax: 303-277-4037

The power supply is essentially a buck converter (see Figure 1). An electronic switch alternately connects the battery to and disconnects it from the input end of an inductor-and-capacitor filter. The inductor suppresses the input current transients, and the capacitor suppresses the output voltage transients. Provided that the switching frequency is much greater than the resonant frequency of the inductor-and-capacitor combination, the average dc output voltage V_o in the steady state is given approximately by

$$V_o = DV_{in}$$

where D = the duty cycle (the fraction of

the switching cycle during which the switch is closed), and V_{in} = the input voltage (the battery voltage minus any voltage drop in the switching circuit).

The power supply (see Figure 2) maintains V_o nearly constant even though V_{in} decreases as the batteries are used up; it does this by sensing V_o and adjusting D accordingly. A voltage proportional to V_o is coupled to micropower switching-regulator integrated circuit U_1 via sensing resistors R_3 , R_4 , and R_5 . Voltage V_o is set by choosing the ratio $R_3/(R_4 + R_5)$, and R_5 is adjusted to compensate for the tolerance in an internal Zener-diode voltage reference and associated components in U_1 .

Circuit U_1 contains an oscillator, the frequency of which (of the order of 30 kHz) is determined in part by C_1 . The sensed voltage on terminal 7 is compared with the internal reference voltage; the difference between them controls the duty cycle of a pulsed version of the oscillator signal at output terminal 3.

Transistor Q_1 is the power switch at the input end of inductor L_1 . Integrated circuit U_2 serves as an analog multiplexer that alternately connects the gate of Q_1 to the negative side of the battery or to the source of Q_1 , under the control of the output of U_1 . Thus, pulses of battery voltage are applied to L_1 at the oscillator frequency and at a duty cycle controlled by V_o .

Inductor L_1 and capacitor C_3 must be chosen carefully to cope with transient loads and to remain within specified limits on size and weight. In this case, L_1 was chosen to be a swinging choke (a nonlinear inductor); as the current increases from light to heavy loads (from 5 to 500 mA), the core of L_1 saturates, causing the inductance to decrease from about 400 mH to 100 mH. Although a linear version of L_1 could be used, tests show that the nonlinear version responds better to transient loads.

This work was done by Colonel W. T. McLyman of Caltech for NASA's Jet Propulsion Laboratory. For further information, Circle 42 on the TSP Request Card. NPO-16889

AMCO

MODULAR CONSOLES

Amco provides infinite styling and quality construction with the most extensive equipment mounting provisions available.

Contactless Coupling for Power and Data

The alignment of this flat-plate interface is not critical.

*Goddard Space Flight Center,
Greenbelt, Maryland*

An experimental flat-plate coupling transmits digital data signals and electrical power across a small gap between two modules. Unlike multiple-pin electrical connectors, the two halves of the coupling do not have to be aligned precisely for mating; thus, the coupling concept may be a useful substitute for electrical connectors in equipment that has to be assembled by robots, remote manipulators, or humans working in protective clothing or otherwise restricted in dexterity.

The coupling includes a power transformer operating at a frequency of 20 kHz. Each of the mating modules contains half of the pot-shaped core of the transformer and a spiral winding (see figure). Two versions have been built: one to transfer

When the call
to TDRSS
doesn't go
through...

there's
no getting
your dime back.

System availability and reliability are the big issues for NASA as it acquires its Second TDRSS Ground Terminal (STGT). Delivery of data to users depends on it.

The Nation's commitment is too great to demand anything less than the objective NASA has established: 0.9999 availability. That's why GE is competing to build STGT; we can respond to the challenge. That's why GE is proposing an all-new distributed data system architecture for reliable operations.

We've designed for low life cycle cost too, by significant reductions in equipment and personnel—to be achieved in hardware, automated operations and proven command and control concepts from current successful programs.

And we've made the human, financial and technical commitment to deliver to NASA on time and within cost.

As the first user of TDRSS, we know how vital STGT is. So, while offering the technical solution that NASA asked for, we're more than just a supplier. We've been there.

STGT will play a key role in Earth/Space communications for years to come...and GE is committed to making 0.9999 availability a reality.

GE Aerospace

Ground Systems Department
Valley Forge, Pennsylvania

Circle Reader Action No. 556

STGT-1

100 W of power, the other to transfer 1,000 W.

The transformer is designed to operate at maximum efficiency with a gap of 10 to 20 mils (0.25 to 0.5 mm) between the halves of the core. This eliminates the need to force the halves into contact and thereby also minimizes wear of the mating surfaces. The 100-W version of the transformer has been tested for its performance with various gaps, lateral displacements, and angular misalignments. Within the tolerance range, the transformer exhibits an efficiency as high as 97 percent.

The data-transmission system includes light-emitting diode (LED) transmitters, positive/intrinsic/negative (PIN) diode receivers, and Motorola (or equivalent) emitter-coupled-logic supporting electronic circuitry. The transmitting and receiving diodes are equipped with lenses that give some divergence to the transmitted light beam and field of view, respectively. Consequently, the digital-signal coupling also has some tolerance to separations and misalignments. The data-transmission system has been tested with a 50-MHz signal representative of a 100-Mb/s nonreturn-to-zero pulse code.

This work was done by John C. Moody and Joseph W. Foley of OAO Corp. for Goddard Space Flight Center. No further documentation is available. GSC-13059

A Split Transformer and Optoelectronic Components transmit electrical power and digital signals, respectively, across a small gap. This coupling would be useful in robotically assembled equipment because it tolerates some misalignment. The coupling offers also higher reliability due to one overall alignment mechanism as opposed to multiple pin/socket alignment requirements.

Multiple-Coil, Pulse-Induction Metal Detector

A large area is scanned rapidly.

John F. Kennedy Space Center, Florida

A multiple-head, pulse-induction metal detector scans an area of 72 ft² (6.7 m²) with a combination of eight detector heads, each 3 ft (0.9 m) square. The new detector, designed for the recovery of Space Shuttle debris, replaces an earlier version that had only one 3-ft-square head and that was based on the tuned-coil principle.

In the tuned-coil principle, the resonant frequency of the coil in the detector head is changed by the detected metal. This principle is not suitable for a multiple-head detector because each head would have to be tuned to a different frequency, and this would entail an impractically large bandwidth. However, the pulse-induction method used in the new detector is suitable for multiplexed operation and does not impose a severe bandwidth requirement.

Figure 1. A **Detector Head** includes a large primary coil that induces current in the smaller secondary coils. An array of eight such heads enables a searcher to cover a large area relatively quickly.

When the calls
come from
TDRSS,
what will
GE's experience
in space mean
to NASA's
new ground
terminal?

GE has been providing NASA with reliable space communications for more than 25 years.

Now there's a new challenge: In the desert near White Sands, New Mexico, NASA's Second TDRSS Ground Terminal (STGT) will soon be built to receive calls from space...

...Critical calls from space. And, that just happens to be a phase of space exploration where GE pioneered. That's why GE is competing to build STGT.

For instance, we were the earliest user of the first TDRSS. Through our involvement with Landsat, we have wide knowledge of TDRSS operational requirements.

Throughout our 25 years of experience, we've worked closely with the Goddard Space Flight Center. We've been a major NASA space network user. We are builders of satellites for NASA/NOAA. We build military and commercial satellites and subsystems. And we build and operate military, civilian, and commercial C² ground stations.

GE's corporate commitment to NASA continues with STGT. We understand the objectives of reliability, operability, maintainability AND low life cycle costs with 0.9999 availability.

STGT will play a key role in Earth/Space communications for years to come...and GE is committed to making 0.9999 availability a reality.

STGT-2

Each detector head (see Figure 1) includes a large, square primary (transmitting) coil, within which are located four smaller secondary (receiving or sensing) coils. The four sensing coils are connected in parallel in such a way that three of them aid the primary-coil induction and one of them opposes it.

An oscillator having a frequency of 250 Hz switches a solid-state relay (see Figure 2) with a voltage of about 8 V. The relay generates a positive voltage pulse for the primary coils every 2 ms. For multiple-head operation, a sequential counter sends the pulses to each detector head in turn. The pulsed current in each primary coil induces a voltage in its secondary coils. This voltage is amplified, rectified, and compared with a reference dc voltage that corresponds to no metal in the detector field.

When metal is present in the detector field, the secondary-coil voltage deviates from the reference level. A departure of ± 5 mV from the reference level causes the comparator to saturate at about 13 V output. The comparator output causes a driver to apply power to an indicator. In tests, the detector indicated a 3- by 3-in. (7.6- by 7.6-cm) box 17 in. (43 cm) from the detector head and a 7- by 12-in. (18- by 30-cm) box up to 24 in. (61 cm) from the detector head.

This work was done by Edward S. Lesky, Alan M. Reid, Wilton E. Bushong, and Duane P. Dickey of Kennedy Space Center. No further documentation is available. Inquiries concerning rights for the com-

Integrated Inverter and Battery Charger

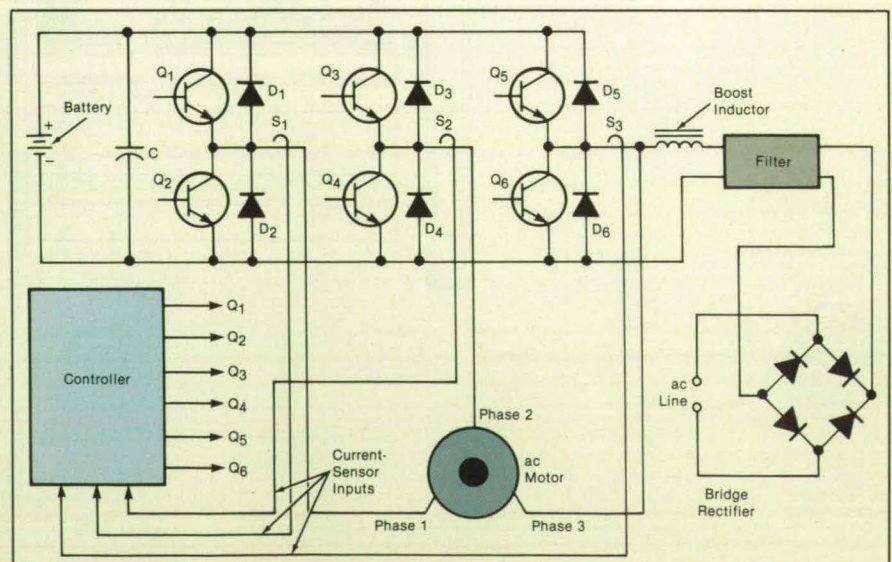

A dual-function circuit would obviate duplication of electrical components and structural parts.

NASA's Jet Propulsion Laboratory, Pasadena, California

A proposed circuit would combine the functions of dc-to-ac inversion (for driving an ac motor in a battery-powered vehicle) and ac-to-dc conversion (for charging the battery from an ac line when the vehicle is not in use). The circuit would automatically adapt to either mode; there is no need to set switches and relays or disconnect cables.

The design of the integrated inverter/charger would eliminate the need for duplicate components, save space, and reduce the weight and cost of the vehicle. It would offer similar advantages in such other applications as load-leveling systems, standby ac power systems, and uninterruptible power supplies.

The circuit would include a three-phase bridge inverter employing pulse-width modulation, an input capacitor, a line filter, a line rectifier, and control circuitry (see figure). For inverter operation, the controller would switch transistors Q_1 through

Many Components Do Double Duty in the integrated inverter/charger.

Q_6 so that voltages and currents of the appropriate magnitude, frequency, and phase would be applied to the motor. Regenerative and reactive currents would be returned to the input capacitor C and the battery by the six antiparallel diodes D_1 through D_6 .

The input capacitor would isolate ac components from the battery, acting as a filter that has an impedance to transients lower than that of the battery. The input capacitor would also supply the inverter current pulses to drive the motor, drawing power from the battery on a steady, averaged basis rather than in pulses. Sensors S_1 , S_2 , and S_3 would measure the currents of the three phases for the controller.

For operation in the charging mode, the controller would modulate the duty cycle of transistors Q_6 to transfer power from the ac line, through the rectifier bridge, the filter, the boost inductor, and diode D_5 to the battery. The controller would act so that the

instantaneous line current would be proportional to the instantaneous line voltage; that is, the circuit would operate at a power factor of 1. As in inverter operation, the input capacitor would isolate the battery from transients. The filter would isolate the ac line from the high-frequency components of the modulation pulses. Sensor S_3 would provide a charging-current signal to the controller.

While the battery is being recharged, the controller would keep the other transistors in the off state. Therefore no currents would enter the motor even though a voltage is present at the junction of D_5 and Q_6 , because there would be no return paths. The motor would not have to be disconnected during recharging.

The leakage inductance of the motor could be used in place of the boost inductor. The low value of this inductance allows some ripple in the charging current, but the ripple would not be objectionable at the

high charging rates that are likely to be used to recharge vehicles quickly. If the ripple were too high for the application, the discrete boost inductor could be retained in the circuit.

Many electrical components could be shared by the inverter and charger portions of the integrated inverter/charger. Other parts that would not have to be duplicated include the battery-connector plug, bus connections, heat sinks, cooling fan, housing, and supporting structure.

This work was done by Wally E. Rippel of Caltech for NASA's Jet Propulsion Laboratory. For further information, Circle 89 on the TSP Request Card.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, NASA Resident Office-JPL [see page 18]. Refer to NPO-17133.

Solid-State Single-Photon Counter

Under the right conditions, an avalanche photodiode performs better than a photomultiplier tube.

NASA's Jet Propulsion Laboratory, Pasadena, California

A commercial avalanche photodiode can be used to detect single photons if it is cooled to an optimum temperature and overbiased beyond its breakdown voltage. Avalanche photodiodes used in this mode offer two to three times the sensitivity of the photomultiplier tubes commonly used for photon detection. Moreover, they are not subject to the disadvantages of photomultipliers: low quantum efficiency, fragile vacuum-tube packages, and anode potentials of about 1,600 V. Avalanche photodiodes thus bring the advantages of solid-state devices to a variety of applications requiring low-level light detection; for example, optical communication, astronomy, remote sensing, optical metrology, and optical signal processing.

When cooled to reduce the number of thermal carriers, an avalanche photodiode can be reverse-biased beyond its normal breakdown voltage to give it an extremely-high internal gain of 10^7 to 10^8 . The performance characteristics of an avalanche photodiode as functions of temperature and voltage were studied in a set of experiments and compared with those of a photomultiplier tube.

An avalanche photodiode was mounted on a cold stage in a small evacuated refrigerator and connected to an external quenching circuit (see figure). The photomultiplier tube, which had a gallium arsenide photocathode sensitive to infrared, was cooled to -30°C in a separate thermoelectric refrigerator. The light from a laser diode at a wavelength of 822 nm was directed at both detectors.

A calibrated beam splitter directed a

known fraction of the laser light to an optical-power meter to enable the determination of the level of light incident on the detectors. Calibrated neutral-density filters attenuated the laser light to a few photons per pulse. A second beam splitter divided the beam between the avalanche photodiode and the photomultiplier tube.

The light source produced 50-ns pulses at a rate of 15 kHz. Corresponding voltage pulses from the light source gated a logic circuit so that it transmitted the avalanche-photodiode counts during a laser pulse ("true" counts) or those during the dark period between pulses ("false" counts), or all counts.

The photomultiplier tube measured the beam intensity after attenuation. From this measurement, the quantum efficiency of the photomultiplier, and the efficiencies of the optical components, the intensity of the light incident on the avalanche photodiode was calculated. Detection probabilities were calculated from this intensity and from the measured number of events detected by the avalanche photodiode.

The optimum temperature for the avalanche photodiode was found to be 200 K. At this temperature and an overbias of 1.5 V (Breakdown voltage was about 175 V.), the single-photon detection probability was 27 percent, compared with 12

The sensitivity of the **Avalanche Photodiode** was measured by comparing with the known sensitivity of a photomultiplier tube. The data were collected and reduced by a pair of time-interval counters, a storage oscilloscope, and a microcomputer.

Technology that takes design capabilities to a whole new plane.

Advanced Composite Systems

Design Freedom. Like no other carbon fiber supplier, we can help you design beyond the limits of today's technology. Our advances in thermoplastic prepregs, for example, offer a whole new world of materials solutions for both aircraft and aerospace applications.

Advanced Properties. Our thermoplastic composite systems offer distinct new advantages. They're reformable. Require no refrigeration. Offer superior toughness in high temperature situations. And require a minimum of manufacturing time.

Strategic Advantages. We're currently the only U.S. based fully integrated manufacturer of carbon fibers. From precursor to prepregs we offer the security of totally domestic production at our Greenville, South Carolina plant. So if domestic fiber is as important to you as it is to us, evaluate our fibers for your next project.

Multidimensional Commitment. We are dedicated to all areas of composites technology: precursor, carbon fibers, and thermoset and thermoplastic resins. We've been on the leading edge of research and development for composites since the early 1960's. Our domestic plants are state-of-the-art, computer controlled facilities. And our technological support is second to none. Even one-on-one if that's what your project requires.

Call us. Ask questions. The earlier you involve us in the development process, the more solutions we can help you find. You can reach Amoco Performance Products, Customer Service at 1-800-222-2448.

We can help even your most advanced designs take off.

GCS Guildline Calibration Services

A Prime Standards Laboratory

The precision measurement community is no stranger to Guildline Instruments.

For over a quarter century, Guildline has supplied Prime Standards and instrumentation at the highest levels of accuracy and precision to National Laboratories and Primary Laboratories throughout the world.

This experience and expertise is the foundation for Guildline's newest service to the test and measurement community... **GCS, Guildline Calibration Services.**

Located in central Florida, this Prime Standards Laboratory provides the following to customers nationwide:

- Direct Traceability to NBS
- Uncertainty levels comparable to National Standards
- Compliance to MIL STDs
- Automatic re-call notification
- Detailed calibration reports
- Rapid service from professional metrologists
- A combined commitment to equipment, facility and staff of over \$1,000,000.

For calibration services second to none, contact: **Guildline Calibration Services, Guildline Instruments, Inc.,** 4403 Vineland Road, Suite B-10, Orlando, FL 32811-7335, (407) 423-8215. Fax: (407) 422-5987

Bipolar-Battery Construction

The components are configured so that the processing steps can be automated.

Bipolar batteries can be fabricated in a continuous quasi-automated process. The components of the battery are configured so that the processing steps can be run sequentially. The key components of the battery, the bipolar plate and bipolar separator, are fabricated separately and are later joined together.

The sequential steps of the process are cutting, masking, etching, plating, folding, and sealing the bipolar plates; inserting bipolar separators; and then compressing, binding, and filling the combination with electrolyte. The assembly of successive battery plates can expand and contract to compensate for thermal and mechanical stresses and volume changes.

This work was done by Wally E. Rippel and Dean B. Edwards of Caltech for NASA's Jet Propulsion Laboratory. For further information, Circle 81 on the TSP Request Card.

Asynchronous Communication Scheme for Hypercube Computer

Average delays are reduced.

NASA's Jet Propulsion Laboratory, Pasadena, California

A generalized scheme has been devised for an asynchronous-message communication system for the Mark III hypercube concurrent-processor network. The scheme is intended to support applications that require the passage of both polled or solicited and unsolicited messages.

The network may consist of up to 1,024 processing elements connected electrically as though they were at the corners of a 10-dimensional cube. Each node contains two Motorola 68020 processors along with the Motorola 68881 floating-point processor utilizing up to 4 megabytes of shared dynamic random-access memory.

The primary goal in designing the software for the communication system is to take advantage of the highly parallel architecture of each node, allowing the main processor to proceed with computations while the input or output is in progress. Secondary goals include offering both packet switching (for single-packet messages) and virtual-circuit switching (pipelining of paths for multipacket messages), along with the ability to expand and reconfigure to support various applications specified by the user.

The scheme includes a regular-message-transfer and a fast-message-transfer mode for communication between nodes. It also addresses such issues as control of the flow of messages, routing, buffering, detection and correction of collisions, and

the control of congestion to prevent deadlock.

In the regular transfer mode (for single-packet messages), a single-packet message is transferred from the shared memory to the local transmitting buffer in the communication processor and is subsequently transmitted in the regular packet-switched mode to its eventual destination along one of the available paths. This path is determined by reference to the message-routing table to locate an available outbound channel.

Each intermediate node that receives the single-packet message either forwards the packet along the forward path if any one of the alternate channels is available or else returns (backtracks) the packet to the last forwarding node that sent this packet. The last forwarding node then reroutes the packet along a different path.

In the fast-message-transfer mode (to be used for multipacket messages), the communication processor starts the process of setting up a path (virtual circuit) to the destination node by using the message-routing table to determine the outbound channels. The technique of setting up a path prior to the transfer of data is called the prior-notification-of-intended-message-transfer/path-validation process and is particularly useful for long messages. Each of the successive intermediate nodes then establishes the path by pipelining the inbound channel-number specification to the outbound channel-number specification by use of a path-setup/reference table in the local memory of each node. At each node, a reverse path is also set up simultaneously for an end-to-end acknowledgment from the destination node.

The destination node attempts to allocate the requisite memory, then responds with an acknowledgment/error packet back to the source along the reverse path. Next, the forward path is confirmed at all intermediate nodes, and the source node is notified to transmit the multipacket message. Meanwhile, the reverse path is deallocated at all the intermediate nodes soon after the acknowledgment. All intermedi-

ate nodes en route to a given destination simply perform a direct-memory-access transfer of data, thus speeding up the data-transfer process by an order of magnitude. The pipelined path in each path-setup/reference table is destroyed when the requisite numbers of bytes have been transferred.

The effects of the communication on an 8-node and on a 16-node hypercube processor were examined in simulations performed on a VAX 11/780 computer. Among other things, the simulation showed that the average delay per packet is less for pipelined messages than it is for packet-switched messages (see figure). The optimal message size for which pipelining reduces the overhead below that of pure packet switching is in excess of 256 bytes.

This work was done by Herb S. Madan of Caltech for **NASA's Jet Propulsion Laboratory**. For further information, Circle 53 on the TSP Request Card.

This invention is owned by NASA, and a patent application has been filed. Inquiries concerning nonexclusive or exclusive license for its commercial development should be addressed to the Patent Counsel, NASA Resident Office-JPL [see page 18]. Refer to NPO-16860.

The **Average End-to-End Delay** per packet increases with the number of hops. This plot was obtained by simulations of the transmission of multipacket messages with an average size of 512 bytes.

Force-Balance Dynamic Display

Six dynamic signals are simultaneously monitored on a single-trace oscilloscope.

Langley Research Center, Hampton, Virginia

A balance dynamic display unit (BDDU) is a compact system that conditions six dynamic analog signals so that they can be monitored simultaneously in real time on a single-trace oscilloscope. The instrument was originally designed to monitor the output of a strain-gauge force balance that measures the aerodynamic forces and moments generated about the three orthogonal axes of a model in a wind tunnel. The system features two display modes that are usable with a conventional, single-channel oscilloscope: a multiplexed six-channel "bar-graph" format and a single-channel display. A two-stage visual and audible limit alarm is provided for each channel.

The BDDU accurately monitors, multiplexes, and displays signals in the input range of ± 100 mV to ± 1 V at frequencies from 0 to 7,000 Hz. Sensitivity and zero-balance adjustments are provided for each channel. For full-scale input, the normalized output is 1 Vdc to both the oscilloscope and the individual buffered outputs. The six normalized buffered outputs provide access for additional recording or analyzing instrumentation.

In the scan mode (see figure), the six multiplexed signals appear as a single trace, on which each channel occupies one-sixth of the total trace width. This mode enables a quick visual overview of the total static and dynamic loads being applied in all axes. In the select mode, a single channel is displayed on the oscilloscope, and the average dc level is displayed on an integral digital panel meter. The BDDU has a thumbwheel switch that enables the selection of any channel for display on the oscilloscope for detailed viewing of any as-

A Typical BDDU Oscilloscope Display in the scan mode shows each channel occupying one-sixth of the total trace.

pect of the signal by use of the normal oscilloscope functions.

Alarms are incorporated into each channel to provide an 8-s visual warning following any pulse of 20 μ s or longer duration that exceeds ± 100 percent of full scale, and a second visual and audible latching alarm is activated when the input signal of that channel exceeds ± 140 percent of full scale for 700 μ s or longer. An additional feature has been incorporated into the BDDU to enable the display of the sum and difference of the signals in chan-

nels 1 and 3 and of the signals in channels 5 and 6.

This work was done by Alice T. Ferris of Langley Research Center and William C. White of Wyle Laboratories. For further information, Circle 63 on the TSP Request Card.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Langley Research Center [see page 18]. Refer to LAR-13658.

High-Speed Multiprocessing for Engine Simulation

Parallel microprocessors have the computational power and speed for realistic simulations.

Lewis Research Center, Cleveland, Ohio

A multiprocessor simulator uses parallel microprocessors to achieve the computing speeds needed for real-time engine simulation. The system has been used to simulate a small turboshaft engine to demonstrate the potential of multiprocessing in such applications.

Real-time simulation aids development of new digital engine controls because it enables the testing of hardware and software under realistic conditions. However, because of the massive amount of calculation required to model a complex engine,

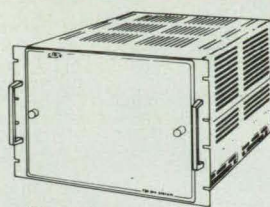

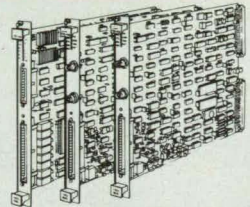

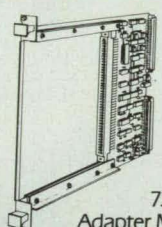

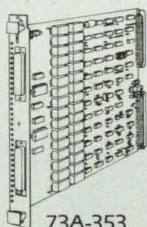

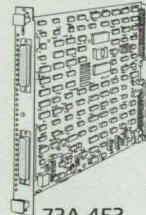

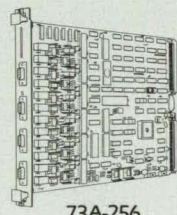

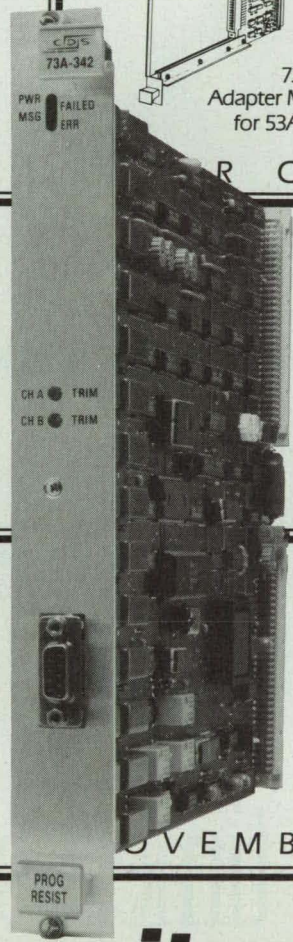

simulation in real time on a single processor demands a fast, dedicated mainframe computer. The new simulator has shown that multiprocessing is an effective alternative to mainframe computing.

In addition to the simulator hardware, a structured macroinstruction-based real-time multiprocessor language and an operating system were developed. The language enables engineers to develop simulation programs, and the operating system enables users to communicate interactively with the system.

The simulator concept is based on $2(n+1)$ processors and $2n$ shared memories connected via two data buses (see figure), where n is the number of parallel processing channels. The demonstration employed four channels and reduced the calculation time for a single processor of the same type by more than half. The processors selected for the demonstration were 16-bit chips; if more-advanced 32-bit chips had been used, even more time would have been saved.

Two processors are reserved for spe-

For the first time, users of UNIX[®] Systems

Announcing ETA System V.

Until today, if you used a system based on the real AT&T UNIX System V operating system, your lips were sealed when it came to working with a supercomputer. Making the move to true supercomputing meant having to learn a complicated proprietary operating system.

Those days are over. Because the first native operating system for a supercomputer based on AT&T's UNIX System V has arrived — ETA System V.

For the first time, users can work with the most powerful

computers in the world using familiar commands.

ETA System V meets all the requirements of AT&T's System V Interface Definition (SVID) Release 3.0. It has passed all 5,500 tests in the System V Verification Suite. It is also the only supercomputer operating system to support features like ipc, semaphores and shared memory. Unlike non-standard operating systems, ETA System V has the advantages of byte addressability, virtual memory support, BSD sockets and r-commands.

ETA System V makes it possible to develop applications on industry-standard workstations compatible with AT&T's

n V can talk to a true supercomputer.

UNIX System V and then compile and run them on any ETA10 Supercomputer — from the affordable ETA10-P, the ETA10-Q and ETA10-E to the world's most powerful supercomputer, the ETA10-G.

Now, all your present applications based on AT&T's UNIX System V can be ported easily to ETA10 Supercomputers. Programs that once took months to port now take hours. Because programs based on AT&T's UNIX System V don't have to be rewritten.

ETA is also developing a library of applications specifically for AT&T's UNIX System V users in higher education environ-

ments. These applications include SPSS, IMSL and DI3000.

If you know AT&T's UNIX System V, you now have a voice in supercomputing. Beginning today.

Talk to your Control Data representative, or: ETA Systems, Inc., 1450 Energy Park Drive, St. Paul, MN 55108. Phone: (612) 642-3460.

ETA10 SUPERCOMPUTERS.

CD CONTROL DATA

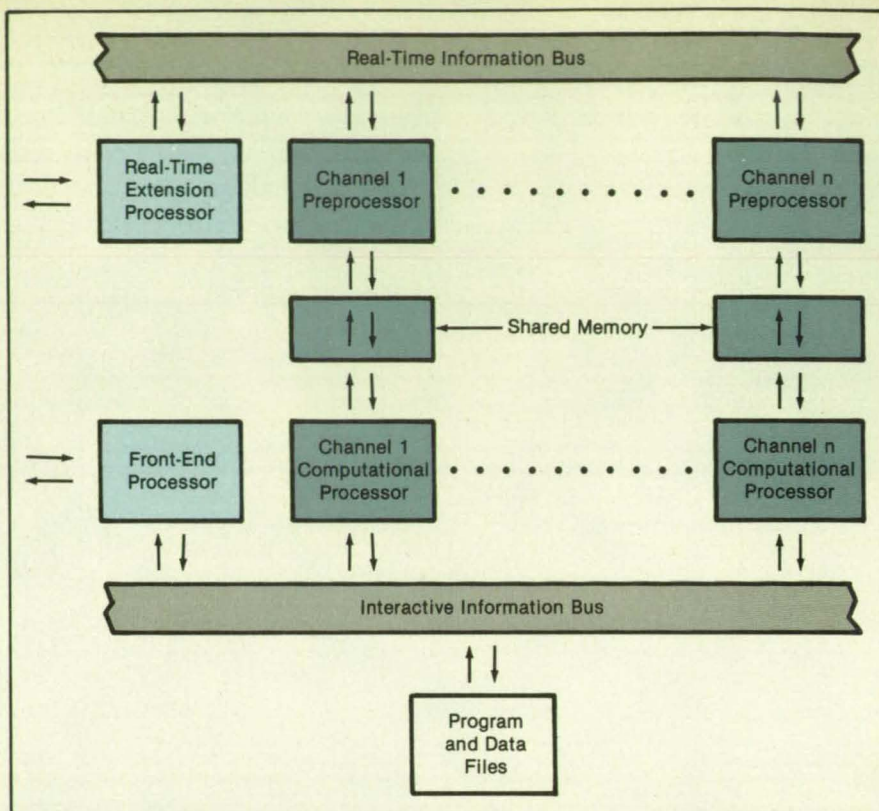

Circle Reader Action No. 626

cial input and output functions, and the remaining processors are available to operate on portions of the simulation. Each channel contains a preprocessor, a memory, and a computational processor. One of the reserved processors, the front-end processor, is the communication link between the user and the simulation. It enables the simulation to run interactively. The user can monitor the results and can make changes in key simulation parameters during a run. The other reserved processor, the real-time extension, is the communication link between the simulator and such external engine devices as actuators and controllers.

The model of the engine — a small unit with 20,000 lb (89 kN) thrust — includes mathematical representations of the following:

- A single-centrifugal-stage, five-axial-stage compressor with variable inlet guide vanes and variable stator vanes for the first two stages;
- A two-stage, axial, air-cooled gas generator turbine that drives the compressor rotor;
- Compressor-exit bleed air that cools the turbine; and
- A second two-stage turbine that is uncooled and has a coaxial drive shaft extending forward through the gas generator turbine to the engine output shaft.

The small-engine model proved to be ideal for demonstrating the system. It was complex enough to offer a challenging problem of partitioning the computations among processors. In determining what equations should go on the various processors, the model developers gained insight and produced generic partitioning algorithms. At the same time, the engine model

The **Interactive Information Bus** links the front-end processor and the computational processors. The real-time information bus links the real-time extension processor and the preprocessors. A computational processor and a preprocessor communicate through their shared memory.

had only six dynamic state variables and so did not require excessive execution time that would delay the development of the system.

This work was done by Edward J. Milner and Dale J. Arpasi of **Lewis Research Center**. Further information may be found in NASA TM-87216 [N86-16221/NSP], "Simulating a Small Turboshift Engine in

a Real-Time Multiprocessor Simulator (RTMPS) Environment."

Simulating Line-of-Sight Radar Returns

Invisible terrain features are removed from further consideration.

Ames Research Center, Moffett Field, California

A computational method has been developed to model the return signals of a ground-mapping radar system for use in simulations where the terrain is in a polygonal form commonly used with computer-generated imagery (CGI). The approach involves the fast rejection of polygons not visible to the radar, to speed the simulation of the radar return. The computational technique can be used to determine which objects in a scene are visible from a specified vantage point and might also be used to determine movements of robot arms that avoid obstacles.

A real-time mathematical model of a forward-looking, ground-mapping radar must produce a range-versus-altitude profile of the CGI terrain along the present flightpath vector (FPV) of the aircraft. The profile is

that determined by the intersection of the vertical plane containing the propagated FPV with the surface of the CGI terrain, given the simulated position of the aircraft and the coordinates of the vertexes of the CGI polygons. In this case, the radar model is for terrain following only. The guidance computations use the information from only one profile per computation cycle rather than from several profiles per computation cycle, as might be required in terrain avoidance.

The procedure begins with the precomputation of nonvarying parameters (pre-flight calculations) that are stored prior to the real-time computations. First, all of the labeled vertexes of the CGI system are stored. Next, the beginning and end points of the line segments are defined for the

CGI data base. Also required are the angular bearings of all line segments (projection in the x-y plane), as referred to the beginning and end points of the lines.

Major circles (each enclosing three or more mountains) are used for quick elimination of as many CGI mountains as possible from the search. Each major circle is defined by the coordinates of the center, the radius, and the table of the mountains included within it. The selection of how many mountains and which ones to contain in a given major circle is arbitrary and is done by trial and error. A choice of three or four should be sufficient. Major circles should not intersect.

A minor circle encloses one mountain with a circle of minimum area. These minimum area circles are found by gradually

The MV3000/32 quadruples the density offered by DEC. Available in 8, 16 and 32 MB boards, Clearpoint's design combines the winning features of greatest density, competitive pricing and unparalleled support.

MicroVAX2000- Compatible

The MV2000/16 MB* nearly triples the density offered by DEC. Achieve identical processor and memory performance to the full configuration Micro-VAX II – at half the cost!

MicroVAXII- Compatible

The MV2RAM/16 MB* places the full system memory capacity on one board. Designed to run cooler and draw less power, the MV2RAM supports jumperless addressing and parity error checking.

SUN

Sun 3/2XX and 4/2XX- Compatible

The SNX2RAM/32 MB*, delivers 32 MB on a single board for the Sun 3/2XX and 4/2XX. Plus, take advantage of the microprocessor-managed "on-board hotline" for local and remote system-independent diagnostics.

Sun 3/1XX-Compatible

The SNXRAM* fits up to 28 MB in just one slot, freeing four slots for peripherals. Using the latest one megabit DRAMs, you get the highest density plus increased reliability.

Sun 3/60-Compatible

The SNXSM comes in 4MB SIMM sets that upgrade your Sun 3/60 to an expansive 24 MB maximum. Each SIMM is one MB of reliable Clearpoint memory with a 1 megabit DRAM to support parity checking.

IBM

RT PC-Compatible

Supporting the upgraded RT models 6150 and 6151, the low-cost RTRAM is available in 4 or 8 MB boards.

APOLLO

DN 4000-Compatible

Bring your DN 4000 up to its 32 MB capacity with the DNX4RAM*. Available in 8 MB boards, Clearpoint's cost-effective memory provides Apollo-equivalent performance with lifetime product support.

DN 3000-Compatible

The economical 1 or 2 MB DNXRAM memory offers Clearpoint's quality engineering and manufacturing with performance identical to Apollo.

APPLE

Mac II-Compatible

Clearpoint offers megabit DIP DRAM memory, the MC2RAM/D; and 256K SOJ-based board, the MC2RAM/S2. Order now!

Circle Reader Action No. 614

shrinking and adjusting an enclosing circle until two vertexes touching the circle define a diameter or three vertexes touching the circle form a triangle whose angles are all nonoblique. Under either of these conditions, the circle cannot be shrunk further and still enclose all the vertexes.

Major and minor circles allow the radar line-of-sight intersections with the data base to be determined rapidly by rejecting large portions of the data base with a simple test. If the distance from the line of sight to a major or minor circle is greater than the radius of the circle, then the line of sight cannot intersect anything enclosed in the circle (see figure).

The computational procedure was applied to the simulation of a terrain-following helicopter and required 17 ms to execute on a SIGMA 8 computer. In contrast, a previous method required about 120 ms. It should be possible to decrease the execution time significantly in future simulations.

This work was done by F. J. Moran and J. D. Phillips of **Ames Research Center**. Further information may be found in NASA TM-88324 [N87-12967/NSP], "A Computational Method To Model Radar Return Range in a Polygonally Based, Computer-Generated-Imagery Simulation."

Phase-Length Optical Phase-Locked-Loop Sensor (PLOPS)

This system provides high resolution without loss of dynamic range.

Langley Research Center, Hampton, Virginia

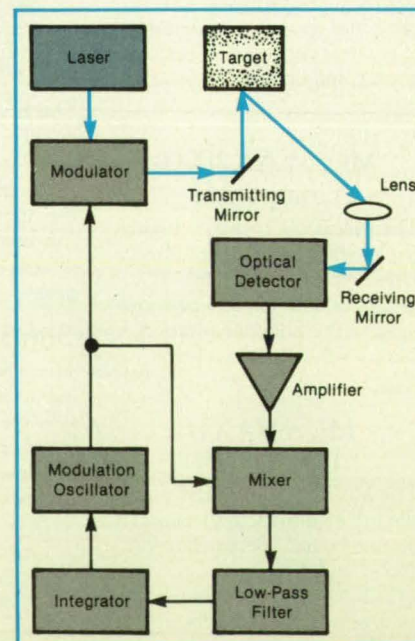

The PLOPS system is designed to provide a high-resolution measurement of the change in optical length from the optical-system source to any optical reflector, including a diffuse reflector. The system has the flexibility to operate from microdimensional to macrodimensional changes. Its use is broad and includes most measurement situations requiring information on length, vibration, and their derivatives. Thus, it can determine distances, structural modal displacements, and vibration frequencies from zero to the high-kilohertz range. Potential applications include building dynamics, remote sensing of vibrations in such systems as turbine-based machinery, monitoring of structural dynamics, noncontacting sensing of surface contours, measurement of large strains as in earthquake monitoring, measurement of atmospheric dynamics and turbulence, high-resolution sensing of humidity, detection of surface acoustic waves by optical microscopy, and related areas.

One version of the optical phase-locked loop (see figure) includes a laser beam as a

carrier of an intensity-modulated energy source. The laser beam passes through a modulator to a transmitting mirror. The modulator varies the intensity of the laser beam at a frequency controlled by the modulation oscillator.

The optical beam is directed by the transmitting mirror to a target. Light reflected from the target is focused by a lens, then deflected by a receiving mirror onto an optical detector that converts the intensity signal into an electrical signal. The signal is amplified and enters a mixer, where the sum frequency is removed by a filter, and the difference frequency is used as a measure of the phase of the modulated signal with respect to that of the modulation oscillator.

The resulting signal is at zero frequency (or dc) and is either a positive voltage or negative voltage, depending on the phase difference between the modulation oscillator and the detected optical signal. At one quadrature point, the voltage will be zero, and the signal integrator will provide a stable operation point for the system by

The PLOPS Serves as an Adjustable Optical Ruler, providing high resolution in the measurements of small and large changes in distance to the target.

Gould announces a more straightforward way to display flight data

You can't get more direct reporting of flight data than with the Gould ES2000. That's because this new recording and display system features an interface which accepts digital data directly and eliminates D/A conversions. You'll increase your manpower efficiency and be confident of noise-free data, since analog calibrations are not needed.

The powerful 68000-based graphics display scrolls data 'strip chart' style in real time. Now you can make high-resolution electrostatic plots only when you need them, greatly simplifying your data reduction tasks by limiting chart paper backup.

Each system accepts up to 10 PB860 plug-in modules, an 8-channel digital coupler with eight event channels. Interfacing is straightforward, too, with IEEE-488 or a high-speed 16-bit parallel port compatible with Gould

and DEC computers.

Since the ES2000 can record digital and analog signals simultaneously, you're always able to maintain an analog link in the event of a computer breakdown.

The ES2000 is an integrated data management tool that can utilize Gould's wide range of intelligent front ends for testing in many aerospace

applications: flight test, wind tunnel, simulation and structural. Plus, an integral floppy disk drive allows you to build a library of application configurations.

And, the ES2000 is fully programmable for automatic recording sequences which can be triggered by analog levels, TTL events, IRIG time, real time or a digital word.

So, take the most direct route to precise data display with the Gould ES2000. It's here to help you win the test of time. For more information, call **1-800-GOULD-10**, or write Gould Inc., Test and Measurement, 3631 Perkins Avenue, Cleveland, OH 44114.

 **GOULD**
Electronics

Circle Reader Action No. 486

feedback control to the frequency of the modulated oscillator. At that point, the frequency of the modulator sets up an exact number of wavelengths in the optical path.

When the phase-locked loop is locked, the condition of quadrature is maintained so that the phase of the system does not change. Any change in the optical-path length, therefore, changes the modulation frequency. As the target moves, the lock frequency will remain at quadrature, and the change in distance to the target can be monitored from the change in modulation frequency. In addition, the device can be aimed to specific targets, spatially locking onto them with an x,y beam wiggler that

operates in a bandwidth different from that of the modulator. Thus the PLOPS can stay locked onto a moving target both spatially and dimensionally.

The PLOPS system has the advantage of high resolution without loss of wide dynamic range. In effect, the choice of the modulation frequency determines the degree of sensitivity of the system. The PLOPS does not depend on coherent reflection from the target and can measure targets that do not have special preparation or corner reflectors. The use of carrier modulation achieves high resolution without the problems of high-speed, short-pulse-duration systems. Thus the PLOPS

has the advantage of simplicity, low cost, and small size without sacrificing resolution.

Microcomputer Board for Space Shuttle Payloads

A general-purpose unit can be configured to control experiments during flight.

A brief report describes the Space Flight 80C86 microcomputer board, which is a configurable general-purpose microcomputer board designed specifically for near-Earth space-flight applications. The architecture of the microcomputer board supports a dual-bus structure.

A local bus provides the essential elements for stand-alone computer operations, and the system bus provides for communication with the subsystems unique to a specific application. The microcomputer board provides for 64 Kilobytes of static random access memory or programmable read only memory, six count-

ers, eight interrupts, and a serial interface. The majority complementary metal-oxide/semiconductor (CMOS) integrated circuits allow for low power and high immunity to noise. The integrated circuits are all screened to Military Specification 883B, which is sufficient for most attached Space Shuttle payload projects.

This work was done by Mitchell L. Davis of Goddard Space Flight Center. To obtain a copy of the report, "Main Control Processor User's Guide," Circle 108 on the TSP Request Card.

PRECISE PRESSURE MEASUREMENTS ...critical!

Testing systems for flight is critical. Teledyne Taber is as critical in the development and production of quality pressure transducers. With 35 years' experience, we're the proven performer. Over 30 different models. Each designed to meet your specific needs.

The Taber line of ground test transducers includes high, low and absolute pressure units with ranges from 0-1 to 0-50,000 PSI.

Ground test models feature:

- Removable pressure caps for inspection and cleaning; some with field replaceable diaphragms
- High levels with DC isolation from signal to excitation
- True differential pressure management
- Positive mechanical stops for high overload pressures
- Excellent thermal stability

Photometer Tracks the Sun

An instrument is designed for use aboard an aircraft.

Ames Research Center, Moffett Field, California

An airborne Sun-tracking photometer enables observations of the Sun to be made during a much greater portion of flights than was previously possible, without special maneuvers of the airplane. Instead of being mounted in an airplane and viewing through a cabin window like previous photometers, the new instrument occupies a dome atop the airplane (see figure). Rotatable over wide azimuth and elevation ranges, the new instrument commands a far larger range of views than was possible through a cabin window. Moreover, the new instrument can be calibrated without removing it from the airplane. The previous instrument and its window had to be removed for calibration after every flight.

The photometer assembly is mounted in a cylinder in the dome. The elevation drive motor, acting through a belt-and-gear connection, rotates the cylinder in a meridional slot to the desired elevation. In a similar manner, the entire dome is rotated to the desired azimuth angle by the azimuth drive motor through a belt-and-gear linkage.

The photometer housing contains six round ports for its six measuring photodetector channels and a square port for four Sun-tracking photoresistors near its exterior end. A transparent optical flat isolates the atmosphere inside the photometer housing. The Sun-tracking photoresistors are parts of a feedback loop that controls the elevation and azimuth of the photometer so that the photometer housing points toward the Sun. The electronics for the control system are located in the dome. The data from the six photodetector channels are sent to the computer located inside the aircraft passenger area.

A resistance heater in the photometer housing maintains a nearly constant temperature for the photodetectors. The optical flat is exposed to outside air at temperatures as low as -60°C . To prevent the flat from fogging because of internal moisture, dry nitrogen is circulated inside the photometer housing.

This work was done by Tak Matsumoto, Cesar Mina, Philip Russell, and William Van Ark of Ames Research Center. For further information, Circle 105 on the TSP Re-

A Fiberglass Dome Protects a Photometer and rotates to aim the photometer in azimuth and elevation to track the Sun. The dome provides a controlled environment for the instrument, including its mechanical and electronic parts.

Open Software
FOUNDATION

Apollo is proud to be a founding sponsor of the Open Software Foundation.

At Apollo, we believe that the real test of a computer company is not only how often it introduces new technology, but also how quickly it makes that technology available at a truly affordable price.

As testimony to this, we offer not simply one workstation under \$10,000, but two entire families of workstations, one of which starts at under \$5,000.

Consider the Series 3000.[™] A Personal Workstation[™] powered like a Porsche[®] but priced like a PC. \$4,990, to be exact. And the new Series 3500.[™] An MC68030 machine that brings high performance to a new low. Making it possible for the first time to obtain a

a single high-performance er \$10,000, you're right.

4-MIPS monochrome system for less than \$8,000, and a 4-MIPS color system for less than \$10,000.

Prices that even include 4MB of memory, a floating-point coprocessor, an IBM PC AT[®]-compatible bus, and a choice of Ethernet[®] or Apollo Token Ring networks.

In addition, like all Apollo workstations, these provide support for industry standards such as UNIX[®] (System V.3 and Berkeley 4.3), PHIGS, X Window System[™] and a host of others, as well as network computing and PC compatibility.

The Apollo Series 3000 and Series 3500. Technology as high as the price is low.

Circle Reader Action No. 635

Stand for Infrared Multiple-Internal-Reflection Mount

Infrared MIR spectra are more reproducible, and MIR crystal suffers less damage.

Langley Research Center, Hampton, Virginia

A new technique prevents lateral movement between the elements in a multiple-internal-reflection (MIR) cell during its assembly. The cell is used in infrared spectroscopy. The reproducibility of infrared MIR spectra relies on the ability to maintain the condition of the crystal, which is the MIR element, and to control the contact between the crystal and the sample. A newly developed yet simple stand does both by eliminating the movement of the mount pieces as pressure is applied and by providing a more consistent way of handling the specimen.

The stand aligns a three-piece mount (see figure), which holds a crystal and a specimen for infrared MIR spectroscopy. The mount is stacked vertically beginning with a bottom piece, which can hold either a liquid or an additional solid sample. A middle piece, which contains the crystal with a solid sample behind it, is placed over the bottom piece with the crystal facing down, matching a triangular arrangement of holes. A cover, which supplies the pressure, is oriented with its three holes in the same manner as that of the first two pieces.

Screws are placed into the three holes and tightened. This assembly stand prevents the movement of the pieces of the mount during the tightening process and thereby prevents the scratching of the crystal. (The scratching of the crystal would reduce the sharpness of the spectrum, resulting in a loss of information.)

The Simple Design of the Stand facilitates the accommodation of any commercially-available mount system.

The stand is constructed of acrylic pieces bonded with epoxy adhesive. On the base are columns of two lengths. The three shorter columns match the thickness of the bottom piece of the mount and hold this piece in place. The four longer columns exceed the total thickness of the three pieces of the mount to accommodate any thickness of sample. These longer columns securely hold the center piece, which contains the crystal, and maintain the position of the top piece, which is as wide as the middle section.

The stand greatly reduces the marring

of the crystal caused by the relative movement of the components of the mount/crystal/specimen stack during assembly. The lifetime of the crystal is increased by approximately an order of magnitude. In addition, the stand reduces the time spent mounting the specimen and increases the reproducibility of the infrared spectra.

This work was done by Edward R. Long, Jr., of Langley Research Center and Cynthia A. Bradbury of Old Dominion University. No further documentation is available.

LAR-13610

Furnace for Rapid Melting and Freezing

An experiment could be conducted in less than 1 minute.

Marshall Space Flight Center, Alabama

A proposed furnace would rapidly heat and cool specimens in material-processing experiments. The furnace would be particularly useful for experiments that require the artificial low gravitation produced by flying KC-135 airplanes in parabolic trajectories. To prevent gravitationally driven sedimentation and convection, the melting of a sample must be started after the airplane has entered the trajectory, and the sample must be completely frozen before the airplane reaches the end of the trajectory, which usually lasts no longer than 30 seconds.

Specimens would be assembled by placing the mixtures of materials to be

melted in disk-shaped crucibles. A large disk area would be used to facilitate the transfer of heat to and from the specimens, and the disk would be thin to minimize the heating and cooling time. Before an experiment, a crucible would be fastened to the end of a specimen holder in the lower zone of the furnace, and the furnace would be preheated to a temperature somewhat below the melting temperature of the specimen (see figure).

In preparation for the experiment, a block of large thermal mass and high thermal conductivity (for example SiN or SiC) in the upper zone of the furnace would be preheated above the melting temperature.

Immediately after the beginning of the brief experimental interval, the furnace would be moved downward to bring the specimen into contact with the preheated mass. A contact pad made of metallic mesh or other porous, flexible material filled with molten gallium or other liquid of low vapor pressure would speed the transfer of heat to the specimen. The specimen would be held in this position until it melted completely.

The furnace would then be retracted from around the specimen. To quench the specimen rapidly, a flow of cooling gas would be directed onto one face of the crucible through a distributor in the speci-

WARNING

WARNING: This 8½ digit DMM will replace your present set-up!

You have been warned... the Model 1281 from Datron is so good, it's hard to resist!

The 1281 is the world's most advanced DMM of its kind; bringing you the ultimate in electrical measurement via its accuracy, functional capability and ease of use.

Take advantage of user selectable resolutions up to 8½ digits backed up by accuracies and repeatabilities to suit the longest scale length. And DCV performance from 10nV to 1000V with 1 year specifications to $\pm 3\text{ppm}$, coupled with true RMS ACV providing 1 year accuracies of $\pm 80\text{ppm}$. High accuracy resistance, current and ratio measurements are also yours with this superb instrument.

At the touch of a key, Selfcal, Datron's unique, accurate method of internal calibration enhances the impressive instrument specifications while providing excellent performance outside controlled temperature environments. This exclusive Datron feature also provides a very comprehensive self test.

If that's not enough to change your present set-up consider High Accuracy Spot Frequency ACV, Low Current Resistance measurement for resistance thermometry and simultaneous Frequency and RMS ACV. The 1281 incorporates menu control which makes it easy to operate and built in as standard is IEEE-488.2, the way forward for test and calibration systems.

For more information, call us today. Our fact filled 1281 brochure will take you through, detail by detail, specification by specification, the world's most advanced DMM.

A Preheated Specimen Would Be Heated Rapidly above its melting temperature by contact with a hotter, more massive object. Once molten, it would be cooled rapidly with flowing gas.

men holder, while an external distributor would direct the cooling gas at the other face. The crucible would then be detached from the holder and replaced by the crucible for the next experiment.

The use of the furnace would be a relatively inexpensive alternative to longer low-gravity experiments in orbit or in parabolic rocket trajectories. Many experimental materials could be processed in the

furnace, including oxidation-resistant superalloys with dispersions of refractory powders, fiber-reinforced glasses and ceramics, electrical contacts with refractory powders dispersed in lower-melting-temperature conductors, high-temperature superalloys reinforced by ceramic fibers, ceramic/metal dispersions, immiscible glasses, alloys of immiscible metals, and foamed ceramics and metals.

This work was done by Edwin C. Ethridge of Marshall Space Flight Center. For further information, Circle 80 on the TSP Request Card.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Marshall Space Flight Center [see page 18]. Refer to MFS-28195.

The display shows a digital terrain elevation data (DTED) image which has been pseudocolored to clarify variations in elevation.

Vision Four 4K X 4K Image Processing

Any lesser system takes longer and misses more.

Greater image resolution means more data, so image processing can become a bottleneck. Unless the processor is Vision Four, new from 3M Comtal.

Think of it this way:

To process a high resolution 4K X 4K image on a lesser system, sectors of the image would have to be separately retrieved, processed, reviewed and stored. Vision Four can store and process the entire 4K X 4K image—even in true color—at one time, so the operator can interactively roam through any part of it in real time.

That means fast processing. But there's more. Up to 16 separate regions of interest can be defined within

Vision Four's two dimensional image memory, and different processes can be run simultaneously on each. Vision Four's fully partitionable image memory also can be divided into any number of smaller images, which can be recalled and processed at the operator's will.

Vision Four operates in conjunction with a DEC VAX* or MicroVAX.* Its completely modular design, vast resident library of image processing primitives and unique menu manager make modification, programming and operation of Vision Four quick and simple.

Vision Four from 3M Comtal. Discovering more detail in less time.

Circle Reader Action No. 319

Laser Pyrometer for Spot Temperature Measurements

The emissivity of the target is measured to assure accuracy.

NASA's Jet Propulsion Laboratory, Pasadena, California

A laser pyrometer makes a temperature map by scanning a measuring spot across a target. Unlike some other optical pyrometers, this one requires no a priori assumption about the local emissivity of the target at the measuring spot. The emissivity is measured as an integral part of the overall measuring process. The scanning laser pyrometer is particularly useful for the non-contact measurement of temperature distributions in the processing of materials; for example, at the liquid/solid interface in a semiconductor melt.

The system (see figure) includes a laser of wavelength λ and a photodetector that has a highly linear response and is equipped with a band-pass filter at wavelength λ . The laser and the photodetector are mounted with appropriate lenses and mirrors so that they both focus on the same small measuring spot.

From the Planck radiation law, the absolute temperature T of the measuring spot on the target is given by

$$T = [T_b^{-1} + (\lambda/C_2) \ln(\epsilon R_b/R_t)]^{-1}$$

where T_b is the temperature of a blackbody furnace used as a radiation standard, C_2 is a constant from the Planck radiation law, ϵ is the spectral emissivity of the target, R_b is the radiance of the blackbody at wavelength λ , and R_t is the radiance of the target at wavelength λ .

Because of the linear photodetector response, an absolute calibration of the photodetector is not required; it suffices to use

$$R_b/R_t = V_b/V_t$$

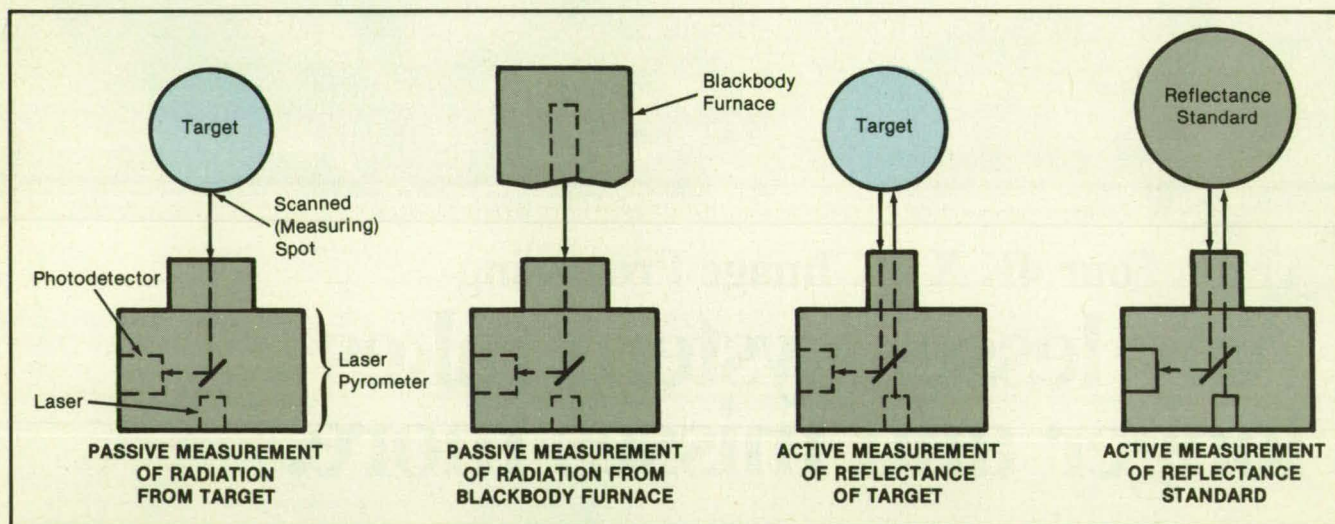

where V_b and V_t are the photodetector output voltage when observing the blackbody furnace and the target, respectively. The emissivity of the target is obtained from the response of the photodetector to the laser radiation reflected from the target (V_{tr}) and to the laser radiation reflected from a gold object (V_{tg}) that is shaped like the target and has a known reflectance r_g . Then the emissivity is given by

$$\epsilon = 1 - r_g(V_{tr}/V_{tg})$$

A nonscanning prototype of the laser pyrometer has been tested with a laser at $\lambda = 0.904 \mu\text{m}$, stainless-steel and carbon spherical targets heated in a vacuum bell jar by radio-frequency induction, and a gold sphere of 0.99 reflectance. This system can attain a temperature resolution of about 5°C at $1,300^\circ\text{C}$. It is anticipated that with the use of a laser wavelength of $1.3 \mu\text{m}$, a signal-to-noise ratio of 10, and a scanning rate of 10^5 picture elements per second, an imaging pyrometer will provide a temperature resolution of 1°C at $1,300^\circ\text{C}$ and a spatial resolution of $10 \mu\text{m}$.

This work was done by D. D. Elleman, J. L. Allen, and M. C. Lee of Caltech for NASA's Jet Propulsion Laboratory. For further information, Circle 87 on the TSP Request Card.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, NASA Resident Office-JPL [see page 18]. Refer to NPO-17024.

The **Scanning Laser Pyrometer** passively measures the radiation emitted by the scanned spot on the target and is calibrated by a similar passive measurement on a blackbody of known temperature. The laser beam is turned on for active measurements of the reflectances of the target spot and of a reflectance standard. From these measurements, the temperature of the target spot is inferred.

Temperature Fluctuations During Crystal Growth

Fluctuations of heat flow during Bridgman crystal growth are correlated with structural features.

Langley Research Center, Hampton, Virginia

A technique has been developed to deconvolve the period and relative amplitude of fluctuations of heat flow in Bridgman crystal growth. A temperature-measuring device with enough sensitivity and frequency response to make the desired measurements is inserted as close as possible to the substance that is to be monitored. The time-dependent temperature

response is recorded, and then the time-domain response is converted to the frequency domain for further analysis. A fast Fourier transform (FFT) of the data on temperature oscillations shows particular behavior at some specific frequencies that corresponds with the striations, or defects, observed on the crystal.

In experiments, the temperature data

were taken with a type K thermocouple. The thermocouple wires were 4 mils (0.1 millimeter) in diameter and provided high sensitivity for both temperature and frequency response. By the use of a computer-controlled waveform analyzer, the analog data were converted to digital data for temporary storage before conversion into FFT's. The original and transformed sets of data could then be stored on a computer disk for later use. A thermocouple meter

Card No. 638

with analog output was used as the interface between the thermocouple and the waveform analyzer. The meter had a 3-Hz response, which was more than an order of magnitude faster than the highest frequency measured. The resulting FFT of typical data is shown in the figure.

The portion of the spectrum near zero frequency represents the steady decrease of temperature caused by the movement of the ampoule through the furnace. For this particular case, the interesting data are at 10 mHz, 25 mHz, and 47 mHz. Striations were found in the crystal at spatial intervals that correspond to the movement of the ampoule during intervals equal to the reciprocals of these frequencies.

This technique appears to be a useful procedure to help determine the sources of some growth-induced crystalline defects. The investigation of other processes that may be sensitive to small temperature fluctuations, such as diffusion, precipitation, and corrosion, may also benefit from this technique.

Detecting Space Dust Particles

The precise times of specific impacts are measured.

Langley Research Center, Hampton, Virginia

A new technique records the times the specific craters are formed in targets exposed in space and permits the determination of the direction in which the impacting particles were traveling at the times of the impacts. After recovery of the targets from space, the compositions of the impacting particles can be established through post-flight laboratory analyses of the residual materials in the craters. On Earth, the technique may have industrial and military uses in the detection of fragments driven by explosions.

The principal parts of the device developed for this purpose (see figure) include a metal-oxide/silicon (MOS) capacitor; an electrical circuit, including a fuse, connected to the metal front plate of the MOS capacitor and the silicon-wafer substrate that forms the other plate of the capacitor; and an attached electronic system capable of maintaining a charge on the capacitor and capable of recording the precise time of discharge. The silicon dioxide layer grown on one surface of the silicon wafer is the dielectric of the capacitor.

A hypervelocity particle striking the electrically charged MOS capacitor produces a temporary conducting path between the metal front plate and the silicon substrate, initiating the discharge of the capacitor. With the proper relationship set between the energy stored in the capacitor and the thickness of the metal plate, the

current density in the conducting path is sufficient to burn away the metal plate from a substantial region surrounding the impact crater. The removal of the metal around the conducting region terminates the discharge process.

When the attached electronic system attempts to recharge the capacitor, the recharge current blows the fuse, preventing recharge. (A built-in current-limiting device ensures initial charging of the capacitor.) Any particle impacts that occur when the capacitor is uncharged do not cause the removal of metal from the crater region; thus, the recorded impact time can be related to a single, specific, readily identifiable crater. The direction of the particle at time of impact is established by the known orientation of the MOS capacitor wafer on the spacecraft at the recorded impact time.

In addition to the study of space dust, studies of the orbital dynamics of particles produced by solid-propellant rocket-motor firings in space can be made using this technique. Because only one impact time can be recorded per capacitor, the total number of impact times recorded is a function of the number of individual capacitors flown. Large detection areas can be obtained by using multiple MOS capacitor wafers or by masking the front metal plates on a single MOS wafer to form multiple capacitors.

The **MOS Capacitor** is short-circuited by the impact of a particle striking it at high speed.

This work was done by William H. Kinard, Donald H. Humes and Philip C. Kassel, Jr., of **Langley Research Center**, Jim Wortman of North Carolina State University, and S. Fred Singer and John Stanley of the University of Virginia. No further documentation is available.

This invention is owned by NASA, and a patent application has been filed. Inquiries concerning nonexclusive or exclusive license for its commercial development should be addressed to the Patent Counsel, Langley Research Center [see page 18]. Refer to LAR-13392.

Status of Sorption Cryogenic Refrigeration

Present equipment and anticipated development are described.

A report reviews the state of the art in sorption refrigeration. Developed in recent years for cooling infrared detectors, for cryogenic research, and for other advanced applications, sorption refrigerators have few moving parts, little vibration, and lifetimes of 10 years or more. The report describes the types of sorption stages, multistage and hybrid refrigeration systems, power requirements, cooling capacities, and the advantages and disadvantages of the various stages and systems.

In sorption refrigeration, low pressure gas is sorbed by physical adsorption (physisorption) on the surface of a material or by chemical absorption (chemisorption) within a solid material (the sorbent). The sorbent is then heated by 100 to 200 °C to desorb the gas at high pressure. The pressurized gas is passed through pre-cooling stages, then expanded in a Joule-Thomson valve where it is partially liquefied and cooled to the final low temperature. The boiling of the liquid removes the heat from the equipment cooled by the low-temperature stage. The low pressure boiloff gas is then reabsorbed by the sorbents, thus completing the cycle.

Rules have been formulated to aid the selection and design of sorption stages to minimize the overall power consumptions and weights of refrigeration systems. The following Joule-Thomson stages and assemblies are recommended accordingly:

- Physisorption of methane on carbon to attain a temperature of 150 to 110 K;
- The preceding stage plus chemisorption of O_2 on $Pr_{1-n}Ce_nO_x$ to attain 90 to 55 K;
- The preceding stages plus chemisorption of H_2 on $LaNi_{4.5}Al_{0.5}$ to attain 30 to 14 K; and
- The immediately preceding system with the H_2 stage augmented by chemisorption of H_2 on slightly cooled palladium or similar material to lower the vapor pressure over the liquid hydrogen, causing it to solidify and sublime at 10 to 7 K.

Nonsorption stages can be combined with sorption stages to reach lower temperatures. A mechanical-compressor J-T helium system can be operated in conjunction with the 14-K hydrogen-chemisorption stage to reach 4 to 5 K. Such temperatures could also be reached by adiabatic demagnetization in series with a hydride stage or with helium physisorption, although this particular sorption stage is extremely inefficient. Future progress in 4 to 5 K long-life refrigerators will probably require the development of nonlubricated mechanical helium compressors or improved cryogenic regenerators for use in Gifford-McMahon or Sterling expansion schemes.

Improved "Green" Forming of Silicon Nitride

Advanced processing techniques reduce the incidence of critical flaws.

Lewis Research Center, Cleveland, Ohio

Silicon nitride (Si_3N_4) is being considered for many applications ranging from components of turbine engines to industrial heat exchangers. More widespread application has been hindered by the inability to make parts with reproducible properties. One reason for this is the uncontrolled introduction of fracture-initiating flaws during processing.

The critical flaws include pores caused by volatilization of organic contaminants, agglomerates that originate in the starting powders, and inclusions or metallic contamination introduced during various processing steps. The incidence of critical flaws induced by processing can be reduced by the processing of powders to avoid organic and metallic contamination and the combination of colloidal techniques with an innovative slurry-pressing technique that avoids agglomeration.

Advanced processing techniques like these were used with two different highly-pure Si_3N_4 powders. Both powders were combined with sintering additives to give a final composition of 87.8 weight percent of Si_3N_4 , 6.4 weight percent of Y_2O_3 , and 5.8 weight percent of SiO_2 . The results with both powders indicate that slurry pressing of "green" (unheated) specimens improves the average flexural strength of the sintered Si_3N_4 by 10 to 15 percent when compared with a conventional dry-pressing procedure.

This improvement is attributed to the reduced sizes and volumes of pores and the elimination of metallic inclusions. The evaluation of the mixing containers indicated that reduced contact with plastic during processing resulted in a reduction in the number of critical flaws attributed to lenticular pores. Such flaws are thought to

result from volatilization of plastic slivers during sintering.

It was shown that slurry pressing at a loading of 20 volume percent of solids is better than pressing at 30 volume percent of solids. The decreased sizes and volumes of pores in the material that contained 20 volume percent of solids may indicate that lower viscosity aids in the removal of voids during pressing. It was also found to be beneficial to mill the Y_2O_3 additive at least to the sizes of the particles of the starting Si_3N_4 powder before mixing the two powders together.

This work was done by Marc R. Freedman, William A. Sanders, and James D. Kiser of Lewis Research Center. Annealing Reduces Free Volumes in Thermoplastics

Reductions reach asymptotic values after several annealing cycles.

Langley Research Center, Hampton, Virginia

High-temperature thermoplastics are excellent candidates for use in aerospace applications. Graphite-fiber composites that contain thermoplastic matrices could have wide applicability. However, previous work indicates that annealing would exert significant effects on the free volumes of thermoplastics. As a result, composites containing thermoplastics could suffer increasing internal stresses at the fiber/matrix interfaces as the free volumes in the matrices change due to variations of temperature during service. To assess the general suitability of thermoplastics for graphite/polymer composites, an investigation was conducted to determine the free volumes and the water-absorption characteristics of two types of thermoplastic polyimide as functions of their annealing histories.

The thermoplastic samples were weighed and immersed in distilled water at 90 °C. They were reweighed at 24-hour in-

tervals and kept immersed until their weights stabilized. The samples were then transferred to a vacuum oven at 100 °C and weighed every 24 hours until they attained new steady weights. The difference between the two stabilized weights for a sample equals the saturation moisture content of the sample. For a noncrystalline sample, the saturation moisture content is directly proportional to its free volume.

Next, both types of samples were annealed for various multiples of 24 hours at a temperature of 200 °C, about 50 °C below their glass-transition temperatures. Both types of samples exhibited reductions in free volume following the annealing cycles. However, the free volumes reached asymptotic values after about four cycles. Finally, the samples were examined by x-ray diffraction to detect any changes that annealing may have produced in their levels of crystallinity. At a confidence level of 95 percent, no measur-

able changes in crystallinity were observed in any of the samples.

Because preanneal and postanneal x-ray-diffraction studies did not reveal any changes in the degree of crystallinity, it appears that any changes in the saturation-moisture weights are related to changes in the amorphous regions, where the primary absorption of water occurs. These regions, besides being generally disordered, also contain free volumes that may change as a result of annealing. The conclusion is that any changes in the saturation-moisture contents of the samples are directly proportional to changes in the free volumes in them. These results indicate that the annealing of thermoplastics reduces their free volumes but that the free volumes reach asymptotic levels beyond which no further reductions are observed.

SCHOTT GLASS... HELPING OUR WORLD SEE OTHER WORLDS

Precision Optical Glass of uncommon dimensions.

When the University of Pittsburgh's Allegheny Observatory was developed around the turn of the century, Schott was the only company capable of making the lens blanks for the Observatory's refracting telescope. Three quarters of a century later, that telescope is still the third largest in the world.

Today, as the lenses of that refracting telescope are being replaced, glass from Schott Glass Technologies — a United States company — is the choice.

In fact, Dr. George Gatewood, director of the Allegheny Observatory, said that there wasn't much of a choice at all. "Schott is the only company in the world capable of producing the glass we need for our refracting telescope lenses."

He's not alone in his thinking. Because of Schott's world-wide involvement and award-winning Research and Development department, Schott glass has been chosen for use in many of the most advanced optical systems man has ever known. Including some of the world's biggest stargazers; like the University of Pittsburgh's Allegheny Observatory.

Schott Glass Technologies is a United States manufacturer of many types of glass. If you're involved in astronomy, space exploration, aerospace, precision measurements or optics, Schott can help you with the right glass for these and many other fields.

Artificial Voids in Ceramic Materials

Small holes are made deliberately to help quantify techniques of nondestructive evaluation.

Lewis Research Center, Cleveland, Ohio

Silicon carbide and silicon nitride are high-temperature structural ceramic materials that are being considered for application in advanced gas-turbine engines. Pores, small cracks, inclusions, and variations in microstructure are strength-limiting defects commonly observed in these sintered silicon-base ceramics. The ability to detect and characterize voids (by sizes, shapes, and locations) in structural ceramics is vital for increasing the strengths and reliabilities of these materials. Ceramic samples containing seeded voids that have known dimensions and locations are essential for determining the quantitative capabilities of nondestructive evaluation techniques applied to structural ceramics.

A method for creating voids in ceramic specimens has been developed. In an example of the method, plastic microspheres

of various sizes were pressed into the surfaces of silicon carbide and silicon nitride "green" bars placed in a die. Additional ceramic powder was added to cover the spheres, and the bars were compacted in such a way that the spheres were buried beneath the surfaces of the bars. The bars were heated to vaporize the spheres, thereby producing internal voids. The bars were then sintered to complete the processing cycle. Several hundred voids ranging in diameter from 25 to 500 μm were thus seeded in SiC and Si₃N₄ specimens.

These voids were fully characterized metallographically and the specimens examined by use of both conventional and projection x-radiography and scanning laser acoustic microscopy. Standard specimens produced and characterized in this way would be of interest to manufacturers

of structural ceramic materials and to researchers and developers of nondestructive flaw detection equipment.

This work was done by Don J. Roth, Edward R. Generazio, and George Y. Baaklini of Lewis Research Center. Further information may be found in NASA TM-88797 [N86-31913/NSP], "Quantitative Void Characterization in Structural Ceramics Using Scanning Laser Acoustic Microscopy."

Stabilizing PFAE Against Oxidation

Stabilized, noncorroding perfluoroalkylether can be used at 300 °C as a hydraulic fluid or lubricant.

Lewis Research Center, Cleveland, Ohio

A new process makes commercial perfluoroalkylether (PFAE) hydraulic fluid more stable in the presence of metals in hot oxidizing atmospheres. The viscosity and molecular weight of the treated fluid are almost identical with those of the untreated fluid.

The process consists of thermal oxidation in the presence of a catalyst (see figure) to remove weak links, followed by transformation of the newly-created functional groups into phospho-s-triazine linkages, which impart antioxidation and anti-corrosion properties. A 66-percent yield of stable PFAE is obtained.

The thermal-oxidative stability of the treated fluid is better than that of the starting material by a factor of 2.6×10^3 , on the basis of the amounts of volatile materials evolved during exposure for 8 hours to an oxidizing atmosphere in the presence of Ti(4Al, 4Mn) alloy. Furthermore, no corrosion occurred in the titanium alloy samples in these tests.

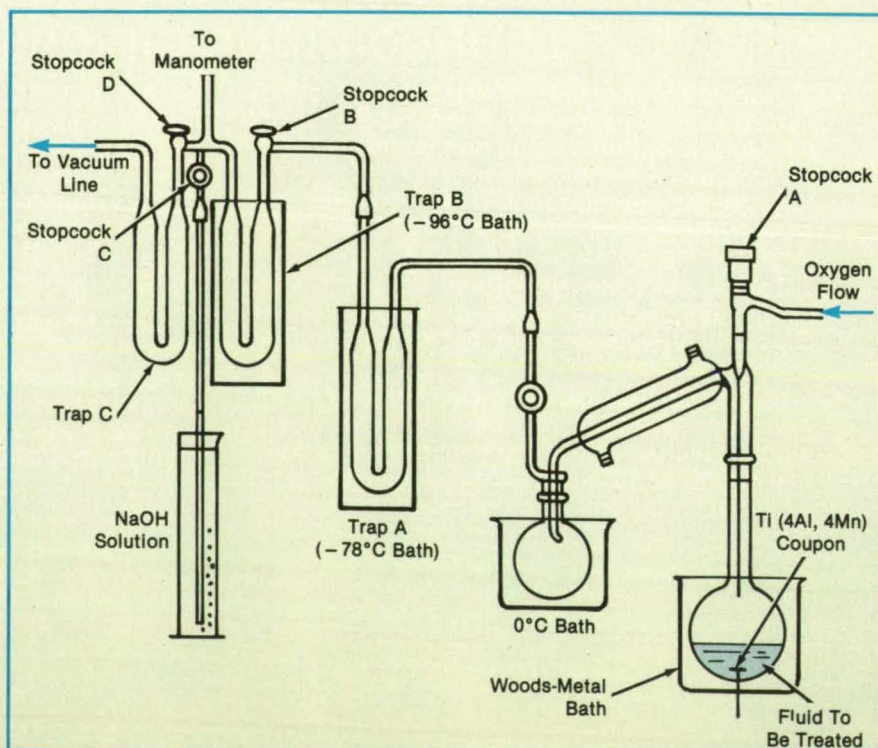

The fluid can be used as a lubricant, grease, or hydraulic fluid at temperatures from -55 to +300 °C in the presence of metals in an oxidizing atmosphere. No other lubricant now available offers this combination of properties.

This work was done by W. R. Jones, Jr., of Lewis Research Center and K.

Paciorek and R. Kratzer of Ultrasystems. Further information may be found in NASA

TM-87276 [N86-25474/NSP], "Improved Perfluoroalkylether Fluid Development."

This Laboratory Apparatus is used in the first step of the production of stabilized PFAE. The traps are used to collect volatile fractions for analysis. The involatile residue is treated further to transform it into stabilized PFAE.

NON-DESTRUCTIVE TESTING: NOBODY ELSE OFFERS SO MANY WAYS TO LISTEN.

The extensive use of composite parts in the aerospace industry has created a need for fast, reliable, cost-efficient methods of testing.

As a major user of composites, McDonnell Douglas had reason to become a leader in ultrasonic testing.

We've developed four highly effective, state-of-the-art ultrasonic testing systems for our own needs. These systems are now available to you.

AUSS-IV, our fourth-generation Automated Ultrasonic Scanning System, is a computer-controlled machine and data handling system that automatically checks parts for anomalies.

AUSS-V, presently under development, will add totally new robotic, data imaging, and computer automation dimensions to ultrasonic testing.

ADIS, our Advanced Data Acquisition, Imaging, and Storage System, can update existing inspection units to provide state-of-the-art data acquisition, imaging, and plotting capabilities. Other features include depth measurements, cross sections, and histograms.

And MAUS, our Mobile Automated Ultrasonic Scanner, allows fast, in-place inspection of composite parts. It can scan the surface of compound curvatures without any special attachments.

To find out more about our systems, and how they can help you increase productivity while reducing costs, call or write: McDonnell Aircraft Company, Dept. 080, P.O. Box 516, St. Louis, MO 63166 (314) 232-7454

AUSS-IV The industry standard.

AUSS-V Adds new dimensions to ultrasonic testing.

ADIS Updates existing inspection units.

MAUS Provides fast, in-place inspection of composite parts.

Organoborosilane Polymers and Ceramic Products

Ceramics exhibit high thermo-oxidative stability.

Ames Research Center, Moffett Field, California

Processes have been developed to make polyorganoborosilane polymers. These polymers are useful principally as precursors to ceramics that withstand high temperatures. In a representative application, the polymer might be drawn into fibers, and then pyrolyzed to produce a ceramic cloth.

In the laboratory, polymers are prepared by coupling reactions of boron halides or organoboron halides with organic halosilanes in an aprotic solvent that has been dried and degassed to remove water and oxygen to the extent possible. In a typical reaction (see Figure 1), 4 to 6 equivalents of an alkali metal are freshly cut and added to the solvent at ambient temperature. The reactants are combined in equimolar amounts and slowly added dropwise to the solvent.

The reaction mixture of solvent plus reactants is refluxed at 120 to 160 °C for 16 to 24 hours. Then an alkyl iodide is added and the reflux continued for an additional time up to 4 hours to consume the excess alkali metal and thereby quench the reaction. The reaction products include the polymers and a precipitate consisting of the alkali halide.

After cooling, the reaction products minus the precipitate are filtered. The filtrate is washed with additional aprotic solvent, then dried in a partial vacuum to obtain the polymers, which usually have molecular weights of 800 to 1,300 daltons. The polymers are generally soluble in organic solvents and melt at temperatures below 150 °C.

To produce ceramic material, a polymer or mixture of polymers is pyrolyzed in nitrogen at temperatures from 600 to 1,100 °C. The resulting ceramic has high thermo-oxidative stability (see Figure 2): it resists both oxidation and weight loss when exposed in air to temperatures up to 1,100 °C.

This work was done by Salvatore R. Riccitiello of Ames Research Center and Ming-ta Hsu and Timothy S. Chen of H. C. Chem Research and Service Corp. For further information, Circle 10 on the TSP Request Card.

Figure 1. The **Precursor Polymers** are prepared by using an alkali metal to couple a boron halide with an organohalosilane.

Figure 2. **Thermogravimetric Analysis** of a polymer prepared from dimethyldichlorosilane and methylboronidibromide shows the loss of weight as the polymer is heated in nitrogen. The resulting ceramic residue shows no weight loss or gain when subsequently heated in air.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Ames

Research Center [see page 18]. Refer to ARC-11649.

Dry PMR-15 Resin Powders

Shelf lives of PMR-15 polyimides are lengthened.

Lewis Research Center, Cleveland, Ohio

PMR-15 polyimides were developed at the NASA Lewis Research Center in response to the need for processable, high-

temperature-resistant matrix resins for fiber-reinforced advanced composites. PMR-15 resins are commercially available

from a number of suppliers and are currently being used in a variety of aerospace, aeronautical, and commercial applica-

tions.

During the manufacture of a PMR-15 resin, a resin solution is prepared by dissolving monomer reactant in an alcoholic solvent of low boiling temperature. The monomer solution is applied to a reinforcement and the bulk of the solvent removed to form prepreg material, which is then cured at high temperature and pressure to form a composite part.

Before curing, the composition of the resin is continually changing because of monomer reactions that occur during storage. The degree and type of these reactions depend on the storage conditions and the solvent content of the resin. Compositional changes in a resin include the formation of soluble higher esters, which severely affect the processability and properties of the composite, and insoluble imides, which precipitate from solution.

Prepreg materials containing low solvent levels (3 to 5 weight percent) can be stored at temperatures from 0 to 40°F (-18 to +4°C) for intervals of 6 months or longer before compositional changes in the resins markedly affect the processing and/or quality of the composites. The storage, before prepping, of resin solutions that have solvent levels of 30 to 50 weight percent of solvent, is limited to a maximum time of 4 months at reduced temperatures before changes in the resins severely affect the processing and quality of composites. The shelf life of solutions stored at room temperature [75°F (24°C)] is limited to 20 days before the reacted materials precipitate.

In a recent study conducted at NASA Lewis Research Center, a simple procedure for significantly extending the room-temperature shelf life of PMR-15 polyimide resin material was developed. The procedure involves the quenching of monomer reactions by the vacuum drying of PMR-15 resin solutions at 70 to 90°F (21 to 32°C) immediately after preparation of the solutions. The absence of solvent eliminates the formation of higher esters and reduces the formation of imides to a negligible level. This procedure provides a fully-formulated dry PMR-15 resin powder that can be readily dissolved in the solvent at room temperature immediately before use. Graphite-reinforced composites prepared from dried resin reactant compositions that had been stored at room temperature for 4 months and 11 months provided PMR-15 composites with processing and mechanical properties identical to those of composites prepared from fresh PMR-15 solutions.

This work was done by Raymond D. Vannucci and Gary D. Roberts of Lewis Research Center. No further documentation is available.

Polaroid's Ultrasonic Ranging System opens the door to new technology.

It can be found in "non-touch" screen computer monitors, AGV's, industrial robotics, electronic games, tape measures, aids for the disabled, loading docks, collision avoidance systems for cars, trucks and pleasure vehicles. And, yes, it even opens doors.

The Polaroid Ultrasonic Ranging System is an accurate, highly sensitive way to detect and measure the presence and distance of objects from 10.8 inches to 35 feet.

What's more, accuracy, sensitivity and range can all be improved with circuit modifications.

Three of a kind. Polaroid offers three ultrasonic transducers for a wide variety of applications. You can choose the original instrument-grade transducer, proven in millions of SX-70 Sonar Autofocus cameras. Or our Environmental Transducer, available in a sturdy housing to withstand exposure to rain, heat, cold, salt spray, chemicals, shock and vibration. And now you can select our newest, smallest transducer, developed for Polaroid Spectra, the camera of the future. All use reliable, accurate and sensitive electrostatic transducer technology. All are backed by Polaroid.

Get a \$2 Million Head Start. Polaroid spent over \$2 million developing the Ultrasonic Ranging System. But now you can get this technology in our Designer's Kit for only \$165*. To order your Designer's Kit, please send a check or money order for \$165 for each kit, plus all applicable state and local taxes, to: Polaroid Corporation, Ultrasonic Components Group, 119 Windsor Street, Cambridge, MA 02139. Powder-Metallurgy Process and Product

Rapid-solidification processing yields alloys with improved properties.

Langley Research Center, Hampton, Virginia

Ingot-metallurgy (I/M) 2XXX-series aluminum alloys based on Al/Cu and Al/Cu/Mg are widely used in aircraft structures where fatigue and fracture resistance and elevated-temperature strength are important design considerations. A systematic study was undertaken to extend the favorable property combinations of I/M 2XXX alloys through the recently developed technique of rapid-solidification processing using powder metallurgy (P/M). The benefits of rapid-solidification processing of P/M 2XXX aluminum alloy compositions over I/M processing were evaluated by comparison with an I/M control alloy.

Rapid-solidification processing, a technology that has greatly expanded the range of compositions and microstructures attainable in metallic materials, typically involves the impingement of a molten metal stream onto a rapidly-spinning chill block or through a gas medium using a gas atomization technique. The Al/Cu/Mg alloys used in this study, which contained various amounts of zirconium, were produced by air atomization of fine powders. The average powder size was maintained between 12 and 15 μm . After atomization, the powders were consolidated into billets and the billets extruded into bars. Standard metallographic procedures were used to examine the microstructures, and mechanical testing was performed with specimen configurations and procedures according to American Society for Testing and Materials standards. Standard tensile, Charpy V-notch, and fracture-toughness tests were performed on the extruded bar in naturally aged and artificially aged conditions.

By and large, the rapid-solidification-processed P/M alloys exhibited strength and toughness properties substantially improved over those of the I/M-produced alloys. Zirconium additions of as high as 0.6

weight percent were used successfully to enhance the alloy properties, while the practical limit of zirconium addition in I/M alloys is about 0.10 to 0.15 weight percent. One promising Al/Cu/Mg/Zr alloy composition was also evaluated in the product forms of plate and sheet. These product forms had a marked advantage in tensile properties and toughness due to the ability of the P/M microstructure to control better the recrystallization and the grain-growth processes. The results of this study indicate that rapid-solidification processing of P/M alloys has the potential of producing 2XXX-series aluminum alloys with strength and toughness properties superior to those of I/M-produced alloys.

This work was done by Henry G. Paris of Aluminum Co. of America for Langley Research Center. Further information may be found in NASA CR-172521 [N87-20406/NSP], "Development of Powder Metallurgy 2XXX Series Al Alloy Plate and Sheet Materials for High Temperature Aircraft Structural Applications."

Effects of Radiation on Elastomers

Graphs and tables are presented for synthetic materials.

A report provides data on the effects of radiation on elastomers. It quantifies the effects by giving the minimum radiation levels to induce changes of 1 percent and 25 percent in given properties. Electrical, mechanical, and chemical properties are included in the data. The combined effects of heat and radiation are briefly considered. The data are summarized in a graphic form useful to designers.

Synthetic elastomers are especially prone to radiation damage but are essential for such parts as gaskets, seals, insulation, hoses, diaphragms, and o-rings. Radi-

NASA Tech Briefs, September 1988

ation tends to change an elastomer from a rubbery material to a brittle one that no longer fulfills its functions.

Graphs show the tensile-strength and elongation data for various materials, including fluorocarbons, silicones, and polybutadienes. Curves for the variation in electrical resistivities with radiation doses are also presented for selected elastomers.

Radiation-caused chemical changes are important because optical and thermal systems can become coated and because humans can be poisoned by gases given off by elastomers. The report tabulates outgassing by several elastomers and notes that polychloroprene and styrene/butadiene rubber evolve gases at particularly low rates.

The report calls for more work to define completely the responses of elastomers to nuclear radiation. The effects of radiation dose rates and the synergistic effects of temperature, radiation, and atmospheric constituents should be explored.

This work was done by Frank L. Bouquet of Caltech for NASA's Jet Propulsion Laboratory. To obtain a copy of the report, "Radiation Data on Elastomers for Designers of Spacecraft and Nuclear Power Plants," Circle 120 on the TSP Request Card. NPO-16747

Choosing an Alloy for Automotive Stirling Engines

Twenty alloys are evaluated for resistance to corrosion, permeation by hydrogen, and high temperature.

A report describes a study of the chemical compositions and microstructures of alloys for automotive Stirling engines. Stirling engines offer the advantages of high efficiency, low pollution, low noise, and the ability to use a variety of fuels.

In an automotive Stirling engine, tubes containing hydrogen, the working fluid, are heated by flames from the burning fuel. For an adequate rate of transfer of heat to the hydrogen, the walls of the tubes must be no thicker than about 0.75 mm. The tube material must be strong enough to contain the hot, high-pressure hydrogen.

Automotive designs call for a peak hydrogen pressure of 21 MPa. The temperature on the flame side will be about 870 °C. Moreover, the tubes must last for at least 3,500 h under such conditions, corresponding to an engine driving life of 100,000 mi (160,000 km).

In the study, 20 alloys — 14 iron-based, 5 nickel-based, and 1 cobalt-based — were evaluated for resistance to oxidation

and corrosion, permeability by hydrogen, and endurance. The iron-based alloys were considered the primary candidates because of their low cost. The nickel-based alloys were regarded as a second choice in case a suitable iron-based alloy could not be found. The cobalt-based alloy was included for comparison but was not a candidate, because cobalt is an expensive strategic material.

An iron-based alloy, CG-27, was selected as the material for Stirling-engine heater tubes. It was the only material that did not fail by creep rupture in engine tests. Moreover, it resisted oxidation and corrosion and formed thin, tenacious oxide layers on its surfaces that act as barriers to permeation by oxygen from outside and by hydrogen from inside the tube.

This work was done by Joseph R. Stephens of Lewis Research Center. Further information may be found in NASA TM-87250 [N86-20541/NSP], "Alloy Chemistry and Microstructural Control to Meet the Demands of the Automotive Stirling Engine."

THE FIRST FAMILY IN LINEAR MOTION:

**AUTOMATION
GAGES, INC.
BALL AND
ROLLER SLIDES**

**NOW
63 MODELS
AVAILABLE
FROM STOCK
FOR IMMEDIATE
DELIVERY!**

When it comes to smooth, precise linear motion, come to the original: Automation Gages. We're the experts in ball and roller slide assemblies. In fact, AG invented the patented single wedge pre-load adjustment technique which permits perfect adjustment with one screw and eliminates all play and backlash. For durability, repeatability, and long term value, AG ball and roller slides have no competition.

AG offers nine basic lines and a total of 63 models available from stock. Travels range from 1/2" to 15" for light, medium and heavy duty applications. And if AG doesn't have exactly what you need, we'll design and manufacture it for you to your

specifications.

In addition to ball and roller slides, AG has positioning and measuring stages and accessories, all available with a phone call. For the best in linear motion, call the first family, Automation Gages, first.

WHAT CAN WE DO FOR YOU?

Here is what Wire Saws have done for others:

1. Cut metals without burrs
2. Cut crystalline materials without breakout
3. Cut semiconductor without surface damage
4. Cut all materials without heat
5. Cut a radius half the size of the wire used
6. Cut all hard materials
7. Cut precious metals with small kerf loss
8. Cut materials in tight places
9. Cut contours (saws computer driven)
10. Cut to some preferred angle
11. Cut insulators
12. Cut composites
13. Cut large size parts
14. Cut radioactive parts
15. Cut precision slits
16. Cut superconductors
17. Cut honeycomb

If one or more of these features will help you, ask for our catalog or call for information. A toll free call might furnish information for you which could solve your problem.

Four-Dimensional Global Reference-Atmosphere Model

Representative pressures, densities, temperatures, and winds are available for any location.

The Four-Dimensional Global Reference Atmosphere Model (GRAM) computer program was developed from an empirical atmospheric model that generates values for pressure, density, temperature, and winds, from the ground to orbital altitudes. This program can be used to generate values of the atmospheric parameters as functions of altitude along any simulated trajectory through the atmosphere.

The program was developed for design applications in the Space Shuttle program, such as the simulation of reentry trajectories of the external tanks. Other potential applications would be studies of global circulation and diffusion and the generation of plots or data for comparison with the results of such atmospheric-measurement techniques as temperature-vs.-altitude data obtained by satellites and infrasonic measurement of wind as a function of altitude.

The program is an amalgamation of two empirical atmospheric models for the low (25-km) and the high (90-km) atmosphere

with a newly-developed latitude- and longitude-dependent model for the middle atmosphere. The high atmospheric region above 115 km is simulated entirely by the Jacchia (1970) model. The Jacchia sections of the program are in separate sub-routines so that other thermospheric/exospheric models could easily be adapted if required for special applications.

The atmospheric region between 30 km and 90 km is simulated by a latitude- and longitude-dependent empirical model that is a modified version of the latitude-dependent empirical model of Groves (1971). Between 90 km and 115 km, a smooth transition between the modified Groves values and the Jacchia values is accomplished by a fairing technique. Below 25 km, the atmospheric parameters are computed by the four-dimensional worldwide atmospheric model of Spiegler and Fowler (1972). This set of data is not included. Between 25 km and 30 km, an interpolation is performed between the four-dimensional results and the modified Groves values.

The output parameters consist of components for latitude-, longitude-, and altitude-dependent monthly and annual means; quasi-biennial oscillations; and random perturbations to simulate partially the variability due to synoptic, diurnal, planetary-wave, and gravity-wave variations. Quasi-biennial and random-variation perturbations are computed from parameters determined by various empirical studies and are added to the monthly mean values.

The UNIVAC version of GRAM is written in UNIVAC FORTRAN and has been implemented on a UNIVAC 1110 under control of EXEC 8 with a central-memory requirement of approximately 30K of 36-bit words. The GRAM program was developed in 1976, and GRAM-86 was released in 1986. The monthly data files were last updated in 1986.

The DEC VAX version of GRAM is written in FORTRAN 77 and has been implemented on a DEC VAX 11/780 under control of VMS 4.X with a central-memory

Real-Time UNIX?

Everyone's talking about it now, but we've been shipping it since 1982. And we've continued to set the real-time standard every year since. RTU™, our real-time enhanced UNIX operating system, provides guaranteed response *plus* the flexibility and compatibility of AT&T System V and 4.2 BSD.

Scientists, engineers, systems integrators, and OEMs can choose from a family of MC68030/020-based multiprocessor computers, from 3 to 25 MIPS, with VMEbus™ and Multibus.™ They're designed for high-performance applications in data acquisition, digital signal processing, imaging, C3I, and real-time simulation.

What's behind the trend to real-time UNIX? Want to learn how your real-time application can benefit from UNIX power and compatibility?

LONGLIB Graphics- Library Program

Curves, maps, histograms, and other graphical outputs can be generated.

The LONGLIB computer program is a set of subroutines designed for plotting vectors on cathode-ray tubes, plotting machines, and dot-matrix and laser printers. LONGLIB subroutines are invoked by program calls similar to standard CALCOMP routines. In addition to the basic plotting routines, LONGLIB contains an extensive set of routines to enable viewport clipping,

extended character sets, graphic input, shading, polar plots, and three-dimensional plotting with or without the removal of hidden lines.

LONGLIB capabilities include surface plots, contours, histograms, logarithm axes, world maps, and seismic plots. LONGLIB includes 'master subroutines,' which are self-contained series of commonly-used individual subroutines. When invoked, the master routine initializes the plotting package and plots multiple curves, scatter plots, log plots, three-dimensional plots, and the like, and then closes the plot package, all with a single call.

Supported devices include VT100 terminals equipped with Selanar GR100 or GR100 + circuit boards; VT125's, VT240's, and VT220 terminals equipped with Selanar SG220, Tektronix 4010/4014, Tektronix 4107/4109, or other compatible boards; and Graphon GO-235 terminals. Dot-matrix printer output is available by using the raster-scan-conversion routines provided for DEC LA50 printers, Printronix printers, and high- or low-resolution Trilog printers. Other output devices include QMS laser printers, laser printers compatible with Postscript, and plotters compatible with HPGL. The LONGLIB package includes the graphics-library source code, an on-line help library, scan-converter and metafile conversion programs, and command files for installing, creating, and testing the library.

The latest version, 5.0, is significantly enhanced and has been made more portable. Also, the format of the metafile in the new version has been changed and is incompatible with that of previous versions. A conversion utility is included to port the old metafiles to the new format. Color-terminal plotting has been incorporated.

LONGLIB is written in FORTRAN 77 for batch or interactive execution and has been implemented on a DEC VAX-series computer operating under VMS. The program was developed in 1985 and last updated in 1988.

This program was written by David G. Long of Caltech for NASA's Jet Propulsion Laboratory. For further information, Circle 159 on the TSP Request Card. NPO-17443

LP4000 with
Multi-pen Changer

Here's what to look for when you want great value

IOLINE plotters are designed to give you more flexibility and features for less cost than any other machine of their kind.

For example, our plotters draw not only on A through E sizes of media, but also plot on hundreds of in-between sizes from 1.5" x 1.5" up to 37" wide roll stock. This saves you time and money by allowing you to make "check plots" on small, low-cost paper before committing to full-size media for final work.

It's easy also to set paper size, pen speed, micro-calibration, plot rotation—everything exactly as you want—by just tapping a few keys on the plotter's intelligent keypad. Plus, up to 3 sets of personalized defaults can be saved in its non-volatile memory.

They're fast, too. Our high-

performance LP4000™ draws at speeds selectable up to 20 inches per second (ips) axially with .001" resolution. For less demanding applications, our economical LP3700™ plots up to 10 ips axially with .0025" resolution.

Another feature is compatibility. IOLINE plotters emulate both HP-GL and DM/PL plotter languages so they work with a host of software like AutoCAD, VersaCAD, and CADKEY, to name a few.

Furthermore, our Multi-pen Changer™ option holds up to 20

pens and, with our hyper-BUFFER™ option, you can dramatically increase plotting throughput with intelligent vector sorting and compression buffering of up to 1MB of plot data.

Now here's the clincher: Our top-gun LP4000 costs just \$5,495* less options. And there are other models priced even lower!

Why wait? Call us now at **206-821-2140**. Or, circle our reader service number and we'll gladly send you our brochure.

Remember, getting your money's worth—that's what IOLINE plotters are all about.

Divergent-Trailing-Edge Airfoil

A wedge concept is integrated into basic airfoil design.

Langley Research Center, Hampton, Virginia

In previous studies, tests of high-speed airfoils revealed the possibility of significant airfoil technology improvements through the application of trailing-edge design criteria different from those currently used. Small wedges were added to the airfoil lower-surface trailing edges, thereby producing significant increases in effective camber and an attendant compressibility-drag reduction. However, the wedge addition also introduced a base-drag penalty because of increased airfoil trailing-edge thickness. At the same time, design studies identified difficulties associated with flap structural-design constraints due to the supercritical airfoil thin aft end.

The current airfoil design, DLBA 238, was developed to produce an airfoil with superior geometric characteristics and equivalent cruise aerodynamic characteristics when compared to the baseline supercritical airfoil DLBA 032. The "trailing-edge wedge" concept, briefly investigated in previous studies, has been improved by integration into the basic airfoil design for the DLBA 238. In this design, the trailing-edge thickness and maximum thickness were constrained to be the same as those of the baseline DLBA 032. Hence, the base drag-penalty of a wedge is avoided. Additionally, the airfoil upper-surface geometry was held fixed.

The effective camber increase of the divergent trailing edge was offset by increasing the airfoil depth from approximately 50-to 95-percent chord along the lower surface. This increased depth is a significant structural benefit because this is the region of the wing that sets the flap and aileron structural depth. The figure shows geometric comparisons of the airfoil sections. The resulting divergent trailing edge is quite evident. In the flap spar region, the airfoil depth has been increased by 30 percent. Some depth is lost between 95-percent chord and the trailing edge. The resulting thickness is still considered quite reasonable.

Calculated upper-surface pressure distributions are nearly the same for both airfoils. The only notable exception is that the DLBA 238 recovers to a slightly lower pres-

The Divergent-Trailing-Edge and Supercritical Airfoil shapes differ most prominently in the trailing-edge region. The divergent airfoil has cruise aerodynamic characteristics essentially equivalent to those of the supercritical airfoil.

sure at the upper-surface trailing edge. However, a considerable difference is noted in the lower-surface pressure distributions. Increased velocities from approximately 56- to 94-percent chord relate roughly to the region of increased airfoil depth. The lower recompression gradient is nearly linear. Calculated drag-rise characteristics for the two airfoils are, by design, essentially the same, and calculated lift, drag, and pitching-moment characteristics of the two airfoils are quite similar at 0.74 mach. Experimental drag-rise characteristics show a slight drag benefit for DLBA238.

Relief Valve Opens and Closes Quickly

The valve reseats after a small pressure drop.

Lyndon B. Johnson Space Center, Houston, Texas

A relief valve opens quickly to relieve excess pressure and closes quickly when the pressure drops slightly below the relief pressure. Although the valve was designed for use aboard the Space Shuttle to vent pressurized hydrazine to vacuum, the valve concept may be useful in industrial applications where rapid opening, rapid closing, or low susceptibility to blockage by the vented fluid is required.

The valve is connected to the pressurized system through its externally threaded end, through which a channel leads to discharge ports (see figure). Normally, Belleville-spring washers push the relief-valve poppet forward until it bottoms on the sealing surface, compressing the O-ring so that it forms a seal at the sealing surface, the O-ring groove, and the discharge ports.

Under moderate pressure, the working fluid flows around the poppet stem, and the differential pressure forces the O-ring into the crack between the poppet and the sealing surface. In this condition, a tight seal is maintained. As pressure increases further, the poppet begins compressing the Belleville-spring washers, and the O-ring moves into the gap between the sealing surface and the poppet face, still maintaining a tight seal.

When the pressure rises to the preset relief pressure, the poppet compresses the washers more. As the O-ring is forced farther into the gap, it uncovers one of the discharge ports with a snap action, allowing the pressurized fluid to be expelled. Additional increases in pressure move the poppet farther and push the O-ring farther into the gap, uncovering additional discharge ports. At the highest pressure, the O-ring is forced completely out of its groove, uncovering all the discharge ports, but still maintaining a seal around the outside of the poppet.

As the pressure decreases, the combination of spring force on the poppet and O-ring elasticity drives the ring back into its groove, and thus the valve snaps closed. The valve reseats at only 5 to 10 lb/in.² (35 to 69 kPa) below the relief pressure.

The reseating is fast because the primary movement is in the O-ring rather than the poppet. For example, as the pressure is raised from zero to a relief pressure of 1,000 lb/in.² (6.89 MPa), the poppet moves a total of only 0.004 in. (0.1 mm). When the valve is reseated at 990 lb/in.² (6.83 MPa), the poppet has retracted only 0.0005 in.

AT LOW PRESSURE

AT MODERATE PRESSURE

AT RELIEF PRESSURE

AT MAXIMUM PRESSURE

The O-Ring Exposes One or More Ports under high pressure, thus releasing excess pressurized fluid. The adjusting screw is used to change the compression on the Belleville-spring washers and thus to set the pressure at which the valve opens.

(0.013 mm). At a pressure of 500 lb/in.² (3.5 MPa), the poppet has returned to its original position.

The following two features prevent the fluid from freezing and blocking the relief valve when it discharges into a vacuum:

1. The discharge-port channels are short, and the fluid passes through them at high speed.
2. The discharge ports are located on the low-pressure side of the O-ring and vent

directly to the outside. As a consequence, the springs and the other parts that engage in relative motion are not wet by the fluid and are therefore unlikely to become stuck with frozen fluid.

This work was done by Paul A. Svejksky of Northrop Services, Inc., for Johnson Space Center. For further information, Circle 114 on the TSP Request Card.
MSC-21209

Shadowgraphs of Helicopter-Rotor-Tip Vortexes

The flow can be studied on full-size rotors instead of on small-scale models.

NASA's Jet Propulsion Laboratory, Pasadena, California

Figure 1. A **Stroboscope Projects a Shadow Image** of a helicopter rotor on a large, square screen. A commercial, highly reflecting projection screen is used; simply projecting the image on a white wall, for instance, would not yield enough light for photographing the vortexes with a standard 35-mm camera.

An optical apparatus produces a full-scale or larger shadowgraph of the tip vortexes of a helicopter rotor. Developed for outdoor experiments, the apparatus can be adapted also to use in large wind tunnels.

In a demonstration, a tail rotor of 0.65-meter radius was set up outdoors and driven by a motor. The rotor speed could be varied from 1,900 to 3,200 rpm. A point stroboscopic lamp illuminated the rotor and cast its shadow on a retroreflective projection screen (Figure 1). The stroboscopic lamp was synchronized with the rotor by a photodetector that sensed the passage of the blade tip. The lamp thus flashed when the tip passed a fixed location, thereby freezing the rotor image throughout the test. A camera near the lamp photographed the image projected on the screen.

The gradations in air density in the vortex generated by the rotor tip made the vortex visible as a shadow of a spiral on the screen. In the demonstration, a hair dryer was used to blow hot air to make the flow around vortex cores visible. The cores are visible (Figure 2) from natural density

Figure 2. This **Shadowgraph** was taken with the apparatus of Figure 1. The flow around the vortex at the right was made visible by hot air from a hair dryer. The rotor tip in this shadowgraph faces the viewer. At the extreme right and left, the shadows appear darker because light rays pass tangentially through the vortexes. The mach number at the rotor tips is 0.64 and the angle of attack is 12° .

There's profit at the end of this tunnel. And it could be yours.

If your product, and profits, can be improved with wind tunnel testing, Boeing aerodynamic testing facilities are at your service through Boeing Technology Services. BTS specialists will work with you to understand your needs precisely, and then will help you tap into Boeing resources efficiently.

Boeing has subsonic, transonic, supersonic and hypersonic tunnels with on-line systems that deliver final plotted

data within seconds. Our special services also include aeroacoustic testing, a captive trajectory system and a separate airflow calibration facility.

We can test your model. Or design and build one to your specifications. Or provide a complete package.

Boeing specialists also can help you develop a testing program to meet your technical requirements, timetable and budget. And we can handle proj-

ects that are classified or that require security for proprietary reasons.

For a full description of the Boeing aerodynamic testing facilities and services available to you, call Paula Royalty, Marketing Manager at (206) 277-4600. Or write to Boeing Technology Services, P.O. Box 3707, M/S 9R-28, Seattle, WA 98124-2207.

BOEING

changes, however.

In the demonstration, the vortexes were visible for a range of tip mach numbers from 0.38 to 0.64. The angles of attack ranged from 4° to 14°. Visibility improved with speed and angle of attack; at higher tip speeds, visibility would probably be even better. Variation of the distance between

the rotor and screen was found to have little effect on the size and clarity of the image. Shadowgraphs at 4.4- and 6.4-meter separations looked similar. Even greater distances could be used with good results.

Two such optical systems could be set up with their axes oriented perpendicularly. It would then be possible to obtain informa-

tion on tip vortexes in three dimensions.

This work was done by Shakkottai P. Parthasarathy, Young I. Cho, and Lloyd H. Back of Caltech for NASA's Jet Propulsion Laboratory. For further information, Circle 135 on the TSP Request Card. NPO-16593

Laminar-Separation Sensor

The sensor detects flow reversal in a boundary layer.

Langley Research Center, Hampton, Virginia

The accurate determination on laminar-flow surfaces of the location and cause of the boundary-layer transition from laminar to turbulent flow is important in basic research for the validation of theory and in developmental testing for the validation of design. Laminar boundary layers form in an accelerating flow with velocity components in the downstream direction. When the local flow decelerates, a laminar-separation bubble can form in the boundary layer. Within the bubble, at the surface, the flow direction is reversed so that the local flow is in the upstream direction. The resultant velocity profile is inflected. Transition to turbulence may occur along the free shear layer over the top of the bubble. The

existence of laminar separation in the boundary layer may thus be detected using a method that senses the direction of local flow at the surface.

The laminar-separation sensor provides a means for detecting a laminar-separation bubble by the use of a very thin, surface-mounted sensor. The sensor consists of a flush array of three proximate thin films, as shown in the figure. The middle film is electronically heated by means of a constant-temperature anemometer (CTA). The outer films, one upstream and one downstream of the middle film, are incorporated into a bridge circuit to respond as resistance thermometers.

When the sensor is exposed to flow, the

heat from the middle film is transferred to either the upstream or downstream resistance thermometer, depending on the direction of the flow. The differential heating of the resistance thermometers is measured by a differential amplifier, and the direction of flow becomes evident from the direction of the signal output. By the proper selection of the film spacing (h), the sensor signals can be made to respond to the smallest laminar-separation bubbles of practical interest. The approximate spacing between elements for typical high-speed subsonic applications is 0.0625 in. (1.59 mm) or less. The orientation of the long dimension of the sensing element in the spanwise direction provides for greater

Pressure Regulators

Specializing in:

- Medium to High Pressures
- High Purity Applications
- Corrosive Media and Environments

Demanding applications call for Tescom pressure regulators. Choose from hundreds of standard models with

from NASA Tech Briefs

The **Laminar-Separation Sensor** is a flush array of three thin-film elements placed along a streamline.

sensitivity of the element to small laminar bubbles.

The three elements consist of a series of polymer-backed thin-film nickel sensors that are dissected to create a predetermined sensor configuration and electrical resistance. They are then placed in a

matrix on a thin polymer sheet and bonded with a suitable adhesive. The resulting sensor thickness is small enough not to cause boundary-layer transition to turbulence in most applications of interest. The CTA's used to heat the middle films are commercially available units, and the film elements

are designed to be compatible with these units.

The nominal resistance of a film is 6.5 ohms or greater to provide the necessary sensitivity. Since the sensors can be manufactured with very uniform resistances, several middle films can be multiplexed onto one anemometer with no adjustment to the system. The sensors can be installed in a staggered fashion or fabricated into one continuous multielement strip of sensors, providing for the measurement of the streamwise movement of laminar separation with changes in the angle of attack.

This sensor is easier to install and involves less circuitry than do systems involving three surface-buried hot wires. In flight at high Reynolds numbers, where the length of a laminar separation bubble may be quite small, this sensor provides the only known surface-mounted means for positively identifying the presence of laminar separation as a cause of boundary-layer transition.

Rim-Supported Turbine Seal

An interstage seal would accommodate a large pressure drop across a vane stage.

Marshall Space Flight Center, Alabama

A proposed interstage seal for a turbine would be supported by the rim of the turbine disk. The seal concept was developed for such small rocket turbines as liquid-oxygen pumps. Usually, interstage seals in these turbines are positioned by snap lands and held in place by tie bolts. The new seal would reduce the number of parts and simplify the rotor configuration.

The seal concept would keep diaphragm-type areas small and thus ensure low axial loads on vanes, because the sealing surfaces are close to the innermost gas-flow path. It is thus well suited to turbines with high pressure drops across vane stages.

In the seal configuration shown in the figure, two blade stages would be supported by a single disk, which is broached over the entire width of the rim. Although a full ring seal is envisioned, segments could be used, as many as the number of blades if necessary.

This work was done by Kent O. Longenecker of United Technologies Corp. for Marshall Space Flight Center. No further documentation is available.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Marshall Space Flight Center [see page 18]. Refer to MFS-28112.

The **Sealing Surfaces Are Close** to the inner diameter of the gas-flow path.

Self-Centering Reciprocating-Permanent-Magnet Machine

The coil can be sized for the required efficiency and power.

Lewis Research Center, Cleveland, Ohio

A new design for a monocoil reciprocating-permanent-magnet electric machine provides a self-centering force. In previous machines of this type, the length of each repeatable section had to be equal to the length of a stroke. This limited the amount of copper that could be used for winding a

coil. The only way to increase power at a given plunger diameter was to use multiple coils. Further, the arrangement of magnets on the plunger was such as to get the plunger locked at either extreme of its travel, because in these positions, the plunger magnets are directly under cor-

responding poles on the stator. Thus, in the absence of current in stator coils, there was a decentering force on the plunger, which gave rise to an undesirable negative-spring effect in the dynamics of the overall reciprocating system.

In the new design, the magnets are ar-

Never out of uniform.

GAF CARBONYL IRON POWDERS

GAF's Carbonyl Iron Powder particles are spherical in shape and, within any given group, uniform in size distribution, from 2 microns to 10 microns.

The only ones that are domestically manufactured, GAF's Carbonyl Iron Powders find ready and broad utility in the aerospace industry in coatings and advanced composites. In addition, their wide range of uniform particle sizes, excellent high frequency absorption, and electromagnetic interference properties recommend them for use in other aerospace applications as well.

GAF's Carbonyl Iron Powders get

along famously with plastic resins, and other metals & alloys, too, like tungsten, copper and bronze. Composites with improved properties are made more easily and economically, usually with no need for additional pre-processing.

If you think GAF's Carbonyl Iron Powders may fit into your plans, our Advanced Technology and Materials Group is available for developmental work on customers' aerospace applications.

All iron powders may look the same. But GAF Carbonyl Iron Powders are always in uniform.

are on the move**

Circle Reader Action No. 404

The **Linear Permanent-Magnet Electrical Motor** includes an outer stator, an inner stator, and a permanent-magnet plunger that oscillates axially between extreme left and right positions.

ranged to produce a centering force. The new design allows the use of only one coil of arbitrary axial length. Thus, the axial length of the coil can be chosen to provide the required efficiency and power output.

The figure shows the basic features of the machine. It has three separate parts: the outer stator, the movable plunger carrying radially magnetized magnets, and the inner stator. The inner stator has the shape of a cylindrical sleeve. The outer stator is shaped to receive a doughnut-shaped coil. Both stators are radially laminated to prevent the induction of circumferential electric currents. They are made of high-

permeability, high-electrical-resistivity material like electrical steel.

The moving plunger includes four cylindrical rings of radially-polarized permanent magnets of samarium cobalt or other strongly magnetic material. Because the magnets are structurally very weak, they are held in the ring configuration by a lightweight, structurally-strong nonmagnetic material. All of these parts are concentric to each other: The moving plunger reciprocates in the annular space between the inner and outer stators.

The left side of the figure shows the plunger in the extreme left position and the

corresponding magnetic-flux paths. When the plunger is moved to the extreme right, the flux paths are as shown at the right side of the figure. The middle of the figure shows the flux paths when the plunger is in the middle position. At this position, the net flux linking the coil is zero. When the plunger is reciprocated sinusoidally by the engine, the flux linking the coil varies sinusoidally, and a voltage is induced in the coil.

Yaw Control at High Angles of Attack

Hinged, conformal forebody strakes provide control when rudders become ineffective.

Langley Research Center, Hampton, Virginia

In a conventional airplane, the rudder becomes ineffective when the craft is operating at a very high angle of attack because of massive flow separation on lifting surfaces. The use of articulated, conformal forebody strakes provides yaw control at such high angles of attack.

The device consists of a symmetric pair of longitudinally hinged strakes designed to fold completely into the forebody contour. The strakes can be rotated individually out into the external flow. The selective deployment of one of the strakes forces a stable, asymmetric vortex pattern on the forebody at high angles of attack, thereby generating a sideward force component. The sideward force, acting considerably forward of the craft center of gravity, produces a yawing moment. Reliance on forced asymmetry of forebody-vortex separation allows this yawing moment to continue unabated to high angles of attack, unaffected by flow separation on wings and aft surfaces.

Figure 1. **Conformal Strake Shape** is generated by an oblique plane intersecting the forebody side.

Figure 2. The **Asymmetric Flow** produced by a deployed strake generates a sideward force that causes the aircraft to yaw.

Figure 1 depicts a conformal strake generated by means of an oblique plane intersecting through the upper quarter to one side of the forebody plane of symmetry; a mirror image of the strake geometry is generated on the other side. The strakes are pivoted to rotate about a longitudinal axis contained in the respective intersection planes. Figure 2 shows a typical cross section of the forebody with one strake deployed. The consequent asymmetric separation of the crossflow at high angles of attack produces a skewed pressure distribution around the forebody circumference, which creates a net side force as indicated. Increasing the strake deflection causes progressive side force increments, thus providing a means of yawing moment modulation.

The principle is equally valid, as demonstrated in wind-tunnel tests, for forebodies of triangular and other noncircular cross sections. The forebody sideward force is maintained at angles of attack well above the typical limit of rudder effectiveness. Wind-tunnel tests have confirmed the effectiveness of this arrangement at angles of attack between 10° and 70°, and sideslip angles to 20°.

Smart muscle machine.

Unpack. Connect. Run. This servo system has already been engineered for you.

SLO-SYN® Direct Drive Servo Positioning Systems bring a unique high torque, low speed capability to motion control system design.

You provide the load shaft. In as little as 30 minutes, these rugged systems are ready to directly power any equipment requiring speeds to 320 rpm and continuous torque from 8.5 to 120 lb-ft with an accuracy of ± 1 arc min. *All without gears or other speed reduction elements that introduce undesirable backlash, cogging and mechanical wear problems.* Your benefits are accuracy, instant motor response and low maintenance or adjustments.

These completely closed-loop systems respond to the user-friendly CNC programming language (RS274) commonly used in factory automation. They can be programmed to operate in position, torque or speed control modes. The brushless, variable reluctance dc servo motors achieve a high torque-to-weight ratio making them ideally suited for such applications as machining, packaging and textile equipment; in robots, transfer stations and pedestals; for process controls, actuators and indexers. The possible applications are so universal that we suggest requirements be submitted for evaluation. Chances are that a Direct Drive Servo Positioning System can be used more efficiently and cost-effectively than any alternative method.

Call or write for your FREE LITERATURE FACT FILE

We have assembled an informative file of relevant SLO-SYN® Direct Drive Servo Positioning Systems literature that will answer all your questions. The file is free on request or by circling the appropriate reader service number.

Gravity Compensation Technique Uses Small dc Motor

The motor is a lighter and more compact alternative to a counterbalance.

Ames Research Center, Moffett Field, California

A small dc servomotor powered by a simple constant-current source and with suitable gearing can be used to cancel the effect of gravity upon the load. The motor can be used in a variety of mechanical systems where a load is to be positioned or accelerated in the vertical plane.

Vertical positioning servosystems, robot arms, and drafting-table arms work better when the energy needed for a required movement is the same for both upward and downward motion. Generally, it is desirable that these systems or arms remain stationary when no motion is called for. Conventionally, these requirements are achieved by means of a counterbalance, some form of spring, or by offset-biasing a servoamplifier.

The dc motor offers the potential of lower weight and smaller size than a counterbalance, greater longevity than a constant-force spring, and servoamplifiers that are enabled to have symmetrical performance in both directions. Furthermore, the system is easily adjusted to accommodate changes in the weight of the load.

For example, in the lead-screw and ball-nut positioning system shown in Figure 1, the gravitational force acting on the load tends to cause the lead screw to rotate — the weight of the load applies torque to the lead screw. A supplementary dc motor is geared to the lead screw and powered so that a countertorque is applied. When this torque is set equal in magnitude but opposite in direction to that induced by the

Figure 1. A Lead-Screw Positioning System has a load counterbalanced by a small supplementary motor powered by a constant-current source.

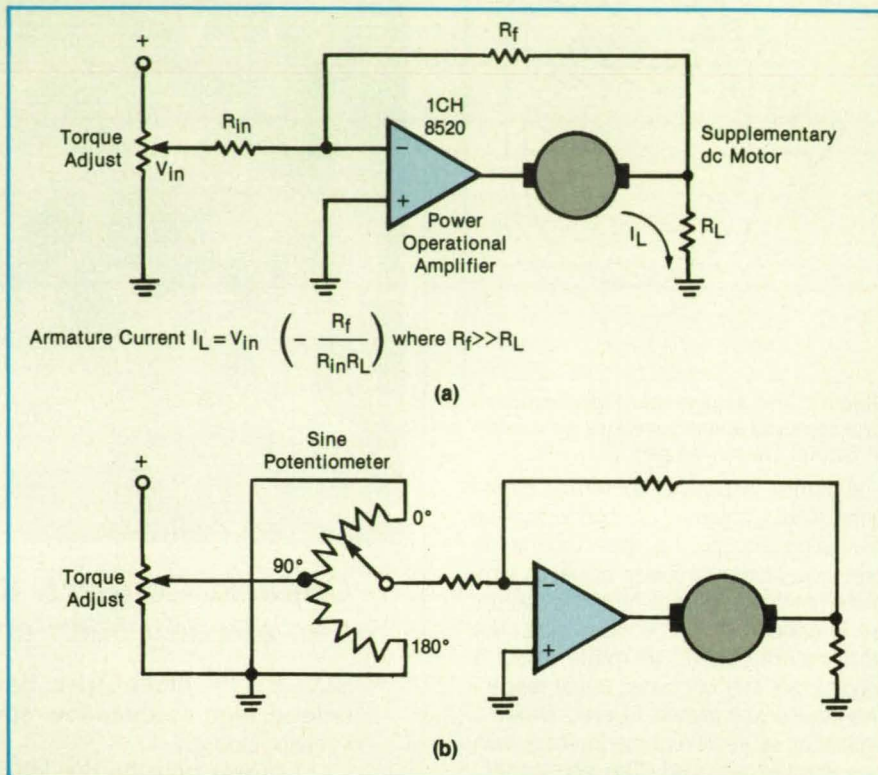

Figure 2. A Supplementary dc Motor and a Method of Counterbalancing are shown. Part (a) shows a 2-A constant-current power supply for a dc motor. A modification to this circuit (b) enables counterbalancing a vertically pivoting arm. The sine-potentiometer wiper is mechanically coupled to the arm and therefore positioned by it.

load, the effect of the load is cancelled. This holds true for both static and a wide range of dynamic conditions.

This occurs because dc servomotors in general are so designed that with a constant armature current they generate an almost constant torque over wide speeds and load range, and the power supply [see Figure 2(a)] for the supplementary dc servomotor is of the type that supplies a constant current. The output level of the supply is adjustable; therefore, adjusting this current sets the countertorque.

To enable the use of the smallest motor and most economical power supply, the gearing is chosen to give a large reduction ratio, but there are limitations. Assuming adequate torque is provided, the reduction-ratio limit is determined by the ability of the supplementary motor to accelerate itself and its gears at a high enough rate so that the positioning system motor has no tendency to drive the supplementary one.

In a lead-screw-positioning-system application, a 1 in. -3 (16 cm -3) sized motor, with a gear reduction of 5:1 and using the power supply shown, was employed to counterbalance different loads of up to approximately 8 lb (36 N).

This method of counterbalancing can also be applied to a vertically pivoting arm.

The only changes required are the addition of a center-tapped "sine potentiometer" to the constant-current supply and mechanically coupling the potentiometer wiper to the arm [see Figure 2(b)].

With the arm horizontal, the supplementary motor torque is initially adjusted for counterbalance. Then, as the arm is driven by the positioning system, the small dc motor current varies as the sine of the arm angle, the current ranging from a maximum when the arm is horizontal to zero when vertical. For a situation in which the arm is required to rotate through 360°, a second potentiometer would be ganged to the first but staggered by 180°. An alternative to sine potentiometers could be a digital encoder, microprocessor, and D/A package. (It should be noted that counterbalancing ceases the moment that current to the supplementary motor is cut off.)

This work was done by Richard Hollow of Ames Research Center. For further information, Circle 21 on the TSP Request Card.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Ames Research Center [see page 18]. Refer to ARC-11525.

Improved Robot-Joint Calculations

Modified Denavit-Hartenberg parameters are better for locating successive joint-axis systems.

Langley Research Center, Hampton, Virginia

The motion of a robot hand is the result of movements of joints in the robot arm. To transform commands from the operator to the robot hand into movements of joints and to pass information from sensors along the arm, the relative locations of successive joint-axis systems must be known. By far, the most popular way to describe the relative location and orientation of one joint-axis system with respect to another is to use the well-known Denavit-Hartenberg parameters.

However, a recent justifiable criticism is that one of these parameters approaches infinity when two successive joints have nearly-parallel rotational axes. Geometrically, this parameter removes the joint axis an excessive distance from the robot arm; computationally, this large parameter leads to an ill-conditioned transformation matrix.

A simple modification in the location of this axis system easily overcomes this disadvantage. This modification results from the insistence that a transverse vector between successive joint rotational axes be perpendicular to one of the rotational axes instead of to both axes. This simple modification leads to modified Denavit-Hartenberg parameters that favorably locate successive joint-axis systems.

In an example of a robot arm with elbow and shoulder joints (see figure), the regular and modified Denavit-Hartenberg parameters were extracted by an algebraic method with simulated measurements of three different locations of a point on the robot arm. For small misalignments of the elbow and shoulder joint rotational axes from a parallel condition, the regular Denavit-Hartenberg parameters locate the elbow-joint system far away from the robot arm; the modified parameters locate the axis system at the desired place on the robot arm. In addition, for a given accuracy of the measurements used in the parameter-extraction process, the extracted values for the Denavit-Hartenberg parameters yielded considerably larger errors than did the extracted values for the modified parameters. It is evident that the modified parameters provide a more natural location of successive joint-axis systems and would be useful in the industrial calibration of robot arms.

This work was done by L. Keith Barker of Langley Research Center. Further information may be found in NASA TP-2585 [N86-27953/NSP], "Modified Denavit-Hartenberg Parameters for Better Location of Joint Axis Systems in Robot Arms."

Predicting Life and Reliability of a Rotating Disk

The effects of design variables, temperature gradients, and speeds are examined.

A report presents a study of a generalized method for the prediction of the fatigue life and the reliability of a rotating disk. The method incorporates the computation of the life, at a given probability of survival, of elemental stressed volumes within the body of the disk.

The effects of speed and of such design variables as the diameter and thickness of the disk and the size, number, and location of boltholes on the life of the disk were determined. An investigation into the effect of a radial temperature gradient as well as the accompanying induced thermal stresses on the relative life of the disk was also performed. In addition, such characteristics of the material as the Weibull modulus and fatigue limit were incorporated into the method.

From the analysis, the concept of a dynamic-speed capacity, N_0 , is introduced. This is defined as the speed that would produce a theoretical life of one million stress cycles at a 90-percent probability of survival. For any speed, N , the life, L , for a given disk at a 90-percent probability of survival is

$$L = \left(\frac{N_0}{N} \right)^{14.3} \times 10^6$$

This method would be useful in the analysis, design, and development of disks for aircraft-engine turbines and compressors and flywheels for industrial and automotive applications.

This work was done by Erwin V. Zaretsky of Lewis Research Center and Todd E. Smith and Richard August of Sverdrup Technology, Inc. Further information may be found in NASA TM-88883 [N87-13755/NSP], "Effect of Design Variables, Temperature Gradients, and Speed of Life and Reliability of a Rotating Disk."

Copies may be purchased [prepayment required] from the National Technical Information Service, Springfield, Virginia 22161, Telephone No. (703) 487-4650. Rush orders may be placed for an extra fee by calling (800) 336-4700. LEW-14582

Cepstral Analysis Detects Ball-Cage Wear

Vibrational frequencies symptomatic of wear are found quickly.

A collection of letters and reports discusses an application of cepstral analysis to the diagnosis of wear in ball-bearing cages in rotating machinery. When the cepstral analysis is performed with the help of a suitable analog computer or digital computer and program, the ball-cage vibrations and changes in vibrations that are symptomatic of wear can be detected

earlier in a test than they can be by more conventional methods based on strain-gauge measurements.

Although there are several alternative definitions of the cepstrum, it can be said in general that a cepstrum is a spectrum of a logarithmic power spectrum. Because of this, a peak in the cepstrum indicates periodicity in the spectrum; usually, this signifies a family of harmonics at equal frequency intervals.

Cepstral analysis is particularly useful in diagnoses of gearboxes and rolling-element bearings because the merging of data on vibrations at harmonically related frequencies into a single cepstral peak

Lightweight, high strength titanium fittings are part of....

Wherever man and machine can go — you'll find reliable Parker instrumentation connectors.

Made in U.S.A.

Parker's field proven automatic butt-weld fittings are now available in lightweight, high strength titanium for aircraft and aerospace applications.

Tough, anti-corrosive, non-magnetic, alloyed or un-alloyed Parker titanium fittings are also available in a wide range of configurations and sizes to meet your system requirements.

makes it easier to assess qualitatively, at a glance, what changes are taking place at a multitude of significant points in the spectrum. The amplitude of a cepstral peak is a function of the individual harmonic amplitudes. Changes in the number and strengths of the harmonics, which usually indicate deterioration of the item under test, cause fluctuations in the amplitude of the cepstral peak. Thus, to detect wear during a test, it may be necessary to watch for changes in only one or a few cepstral peak(s), whereas it would be necessary to monitor many peaks in a spectrum.

For example, in the case of a turbopump ball-bearing cage that was the object of

these studies, it was found that wear could be monitored by observing only the cepstral peak that corresponds to the fundamental frequency of the ball-cage vibrations: subsequent cepstra clearly showed the rise of the ball-cage frequencies and their modulation effects relative to the cepstral peak due to the rotation. This represents a great reduction in the analytical effort required by the previous spectral-analysis technique, which required the generation and examination of calibrated spectral isoplots throughout a test.

This work was done by Gary E. Weese and Michael G. Hine of Rockwell International Corp. for Marshall Space Flight

Center. To obtain a copy of the collection, "Ball-Cage Frequency Detection Using Cepstrum Analysis," Circle 130 on the TSP Request Card.
MFS-29187

Solid Rocket With Integral Case

The propellant and case would be manufactured together.

A report describes a proposed solid-propellant rocket motor. The case of the motor would be integrated with the propellant and would itself burn and produce thrust as the propellant combustion proceeds outward. The proposed motor would increase the payload-weight capacity.

During manufacture, structural fibers would be embedded in a poured propellant matrix. When the matrix hardens, the fibers and matrix would form an integrated propellant and case. When the rocket motor is ignited, the stress created by the pressure of the burning core would be passed to and absorbed by the fibers. The propellant cylinder would be covered only by a thin shell, which would protect against fire and damage during handling.

The propellant would be formulated so that it produces a high pressure and thrust at lift-off. Later, as the burning region includes the integrated case, the formulation would burn more slowly, reducing internal pressure on the then-weaker wall. The rocket motor would thus be strong and stiff and would dampen vibration most effectively during lift-off and initial flight, when loads are highest.

On the Space Shuttle, the payload capacity of 32,000 lb (14,500 kg) would be increased by about 72 percent by use of the new solid rockets. To achieve this improvement, however, the weight of the integrated case would have to be no greater than that of the standard solid rocket motor with graphite/epoxy case. The total specific impulse will have to be as large as that of the standard case and propellant. In addition, the outer protective shell and any unburned integrated-case material would have to weigh no more than 20 percent of the standard case weight. The potential increase in payload would be even larger for launch vehicles that use only solid rocket motors, particularly multistage vehicles.

This work was done by Carleton J. Moore of Marshall Space Flight Center. To obtain a copy of the report, "Integrated Case and Propellant Solid Rocket Motor," Circle 39 on the TSP Request Card.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Marshall Space Flight Center [see page 18]. Refer to MFS-28263.

Rotary Joint for the Space Station

Earthbound solar-power systems could also benefit from this development.

Solar-power-conversion units for the Space Station must be capable of tracking the Sun at an approximate orbital rate of 1 revolution per 94 minutes. The most critical mechanism aboard the station will be the rotary joint that performs this tracking function, because it must position the solar photovoltaic receiver and the solar dynamic collector to face the Sun within about 1° and 0.1°, respectively.

Due to the large inertias of these solar receivers and the lengths of the transfer booms, structural stiffness across the "alpha" joint must be maximized to reduce deflection and accelerations as well as to maximize the rate of response of the actuator. The joint must contain a rotary means to transfer electrical power and data signals across the rotary interface. Furthermore, the rotary drive mechanism must provide smooth motion, possess long life in a space environment, and have intrinsically fail-safe characteristics.

A study was conducted to determine the optimum mechanism for the rotary joint. The results of the study indicated that the

best mechanism would be a continuously rotating joint based on the concept of a multiple, discrete bearing-supported joint driven by a self-loading, "pinch"-roller drive actuator.

This mechanism provides greater protection against catastrophic jamming, less sensitivity to adverse thermal gradients, greater accessibility to maintenance or replacement, and greater adaptability to very large truss members than do more-conventional continuous-support-bearing/gear joints. Furthermore, wear-life estimates show a continuous service life more than two orders of magnitude greater than that required for this application. This rotating-joint mechanism would be applicable not only to solar-power-conversion units but also to Earthbound solar-power farms and other related power-generation systems.

This work was done by Stuart H. Loewenthal and Fredrick T. Schuller of **Lewis Research Center**. Further information may be found in NASA TM-88800 [N86-30206/NSP], "Feasibility Study of a Discrete Bearing/Roller Drive Rotary Joint for the Space Station."

LEW-14542

Seals for Cryogenic Turbomachines

An analysis considers the effects of seals on stability.

A report presents a method of calculation of flows of cryogenic fluids through shaft seals. The calculations agree reasonably well with experimental data. Although the primary function of a seal is to control leakage, an important secondary purpose is to provide dynamic stability; a seal properly designed according to computational fluid dynamics and experience can enhance the stability of a turbomachine. The calculations take this secondary purpose into account.

The report discusses leakage rates and relations between pressure profiles and direct stiffnesses of three seal configurations. It relates the pressure profiles to postulated zones of secondary flow or separation.

The injection of fluid augments direct stiffness, the report notes. Flow choking can occur within a seal. In a stepped configuration, choking diverts the flow and causes a crossover of the pressure profiles in the upstream step and negative stiffness locally, but the flow separates within the step thereby increasing the overall direct stiffness. A similar effect occurs in a cylindrical seal. In a stepped labyrinth seal, carryover diminishes from the entrance and creates a crossover in the pressure profiles in each of the three steps. The local direct stiffness changes from positive to negative.

Pressure measurements taken at 0° and 180° along the axial length of a seal are not enough to define maximum-to-minimum pressure variations and zones of secondary flow. Instead, measurements must be augmented by three-dimensional computations and intuition.

The key to stability turns out to be the local average velocity in a seal. The local average velocity is strongly influenced by effects of the inlet and outlet and the injection of fluid. Thus, for accuracy, the local variations in the average dynamic coefficients must be integrated into the analysis.

This work was done by Robert C. Hendricks of **Lewis Research Center**, L. T. Tam of CHAM, M. J. Braun of The University of Akron, and B. L. Vleck of Rensselaer Polytechnic Institute. Further information may be found in NASA TM-88919 [N87-15442/NSP], "Evaluation of Seals for High-Performance Cryogenic Turbomachines."

Erosion-Resistant Water-Blast Nozzle

A tapered design imparts long life and effectiveness.

Marshall Space Flight Center, Alabama

A new high-pressure water-jet nozzle for stripping coatings from structures lasts longer than traditional water-blast nozzles. The design of the nozzle reduces erosion of the orifice by the turbulent high-pressure water flowing through it.

The new nozzle has higher efficiency, as shown by the greater flow rate of 20 kpsi (138 MPa) water compared with that of a traditional nozzle of the same orifice size. In addition, the new nozzle strips away such coatings as paint, primer, and insulation more rapidly and more completely.

The improved performance and resistance to erosion were achieved by giving the interior nozzle surface a long, gradual convergence before the exit orifice and an abrupt divergence after the orifice (see figure) and by machining this surface to a smooth finish. Stainless-steel alloy 17-4 PH/900H (or equivalent) was selected as the nozzle material for its strength and hardness. The nozzle can be attached to the water source by a standard 3/4-in. (1.9-cm) connector.

The nozzle produces a jet with a long core. It can therefore be positioned farther from the work than traditional nozzles, so

The **Taper in the Stripping Nozzle** reduces erosion. The nozzle mates with a standard connector.

that the probability of a collision with the workpiece is reduced when the nozzle is used by a robot.

This work was done by Marion L. Roberts of Marshall Space Flight Center and R. M. Rice and S. A. Cosby of USBI Booster Production Co. No further documentation is available.

Title to this invention has been waived under the provisions of the NASA Act [42

U.S.C. 2457(f)], to the USBI Booster Production Co. Inquiries concerning licenses for its commercial development should be addressed to

USBI Booster Production Co.

Erosion-Resistant Water-and-Grit-Blasting Assembly

A unit releases a jet of abrasive-containing water.

Marshall Space Flight Center, Alabama

A nozzle assembly adds abrasive particles to a high-pressure water jet. The assembly includes the new tapered stripping nozzle described in "Erosion-Resistant Water-Blast Nozzle" (MFS-28218) in this issue of *NASA Tech Briefs*. The addition of abrasive particles to the jet from the tapered nozzle enhances the ability of the jet to remove coatings quickly and effectively. At the same time, the assembly shares the erosion resistance and longevity of the tapered nozzle.

The assembly includes an abrasive injector and an exit nozzle (see figure). The abrasive injector slips over the tapered

stripping nozzle and screws into the standard 3/4-in. (1.9-cm) connector, replacing the gland nut that ordinarily retains the tapered nozzle. The connection uses no O-rings or backup rings. Commonly used as seals in conventional grit-blast nozzle assemblies, such rings tend to be extruded under high pressure and eventually fail.

The partial vacuum created in the abrasive-injector housing by the water flowing from the tapered nozzle draws the abrasive particles into the exit nozzle. Like the tapered nozzle, the exit nozzle is made of 17-4 PH/900H (UNS S17400) stainless-steel alloy and is gradually tapered and

smoothly finished in its converging section to minimize erosion. It ends in a cylindrical exit orifice.

If desired, the nozzle assembly can be used for nonabrasive stripping by simply closing the abrasive-supply line. The long, straight jet created by the tapered stripping nozzle is retained, and it is not necessary to remove the abrasive injector from the tapered nozzle.

This work was done by Marion L. Roberts of Marshall Space Flight Center and R. M. Rice and S. A. Cosby of USBI Booster Production Co. No further documentation is available.

The **Abrasive Nozzle** is combined with a high-pressure tapered stripping nozzle and a standard connector. The partial vacuum in the relatively large chamber of the abrasive-injector housing entrains the grit particles from the abrasive supply.

Title to this invention has been waived under the provisions of the NASA Act [42 U.S.C. 2457(f)], to the USBI Booster Production Co. Inquiries concerning licenses

for its commercial development should be addressed to
USBI Booster Production Co.

Laser Micromachining in a Reactive Atmosphere

Chemical reactions remove machining waste.

NASA's Jet Propulsion Laboratory, Pasadena, California

The drilling of deep holes in silicon by a laser beam is aided by conducting the operation in a reactive atmosphere. The atmosphere reacts with material ejected from the hole and converts the material to a gas that flows away from the work area. The hole is cleaner and more sharply defined, and debris do not spatter the surface of the work.

When holes are drilled in a silicon chip by a laser beam in air or in an inert atmosphere, solid debris collect around the holes. However, if the procedure is done in chlorine gas, the silicon vapor and droplets leaving the hole combine with the chlorine to form silicon tetrachloride gas.

In a demonstration, holes 0.030 and 0.003 in. (0.76 and 0.076 mm) in diameter were drilled in silicon wafers in various atmospheres. A portable manifold controlled the flow of air, oxygen, nitrogen, argon, or chlorine in a microscope-stage reaction chamber. A ruby-laser beam entered the chamber through a thin glass window.

The holes drilled in a chlorine atmosphere were more regular than those drilled in air, nitrogen, or argon and were completely free of debris (see figure). Drilling in oxygen converted the ejected silicon to fluffy white silica debris that interfered with visibility but probably did not damage the

Spattered Silicon surrounds laser-drilled holes, except those made in a chlorine atmosphere. The reaction of silicon and chlorine not only eliminates debris but also makes the holes more nearly round.

silica layer on the wafer surface.

ENERGETIC NEW ADDITIONS.

You've already met our first diode pumped solid state laser, 70 mW CW at 1.06 microns.

Now we're introducing two new lasers. Both are Q-switched for high energy per pulse: 20 micro joules in the infrared and 5 micro joules in the green.

The small infrared pulsed laser is just 92 mm long and 19 mm in diameter! And the green laser is only 45 mm longer.

You control pulse rate and amplitude. And you can trigger single shot pulses.

Small size and a flexible fiberoptic connection to the power supply make these lasers ideal for applications where you need a moving or compact laser head, such as, micro-machining of semiconductors, laser ranging, cell sorting, writing, scribing, or trimming.

The compact power supply is available with one laser diode, or two for extra power.

For an introduction to our new model 7950 Q-Switched Diode Pumped Laser call us at 800-227-8054. In Europe phone us at 49-6151-7080.

Arc Plasma Gun With Coaxial Powder Feed

Powder is injected directly through the cathode into the plasma jet.

Lewis Research Center, Cleveland, Ohio

A redesigned plasma gun provides improved metallic and ceramic coatings. In a present arc plasma gun, the particles to be sprayed are injected orthogonally to the plasma jets either outside the nozzles or internally through circularly distributed holes in the nozzles (see Figure 1). With this method of injection, only some of the particles penetrate to the central region of the jet, and a significant part of the injected particles becomes entrained in the external, relatively cooler region of the plasma jet. This causes the injected particles to acquire a spectrum of velocities and temperatures, and some of them are either partially melted or totally unmelted.

To provide a more-uniform temperature and velocity distribution of the particles in the improved plasma gun, the particles are injected directly through a coaxial bore in the cathode into the central region of the plasma jet (see Figure 2). In this manner, the particles are introduced into the hotter and faster region of the plasma jet.

In addition, the coaxial injection increases the time of residence of the particles in the plasma jet and eliminates the cooling effect of the feeder gas on the plasma. In this case, the feeder gas becomes a part of the arc gas. Another feature of the new design is the cooling of the cathode by the feeder gas. To optimize the performance of the plasma gun for various powder and arc gases, the position of the cathode can be adjusted.

This work was done by Isidor Zaplatynsky of Lewis Research Center. No further documentation is available.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Lewis Research Center [see page 18]. Refer to LEW-14539.

Repair of Graphite EDM Electrodes

These electrodes can be repaired by a silver-filled, epoxy-based adhesive.

Marshall Space Flight Center, Alabama

The cost of electrical-discharge machining (EDM) can be reduced by use of an electrically conductive adhesive to repair worn or damaged sections of the graphite electrodes. Previously, damaged electrodes had to be replaced, because they were made without extra stock for remachining.

To provide extra material for remachining, pieces of graphite can be bonded to a damaged electrode with Eccobond (or equivalent) silver-filled, epoxy-based adhesive. Because this adhesive is electrically conductive, the electrical conductivity of the electrode is not impaired. Once repaired, the electrode is machined to the de-

signed configuration and returned to service.

This work was done by Glenn Burow of Rockwell International Corp. for Marshall Space Flight Center. For further information, Circle 51 on the TSP Request Card. MFS-29138

**General Plasma's
Quality Essentials™ system
assures reliable coatings
at every step in the process.**

QE™, General Plasma's exclusive Quality Essentials™ system, systematically checks and re-checks process variables to guarantee ultimate coating integrity and repeatability. As a result, our thermal spray coatings meet and exceed the tough standards established by the aerospace, electronics, defense, electric power, petrochemical, medical and other manufacturing industries.

1 Upon arrival, your parts are thoroughly inspected to verify counts, dimensions and condition.

2 Our engineers set strict parameters for thickness, hardness, bond strength and coating integrity. Their instructions follow your parts throughout the process.

3 Precision masking of parts assures coating is applied only to critical surfaces and protects their cosmetic quality.

4 Bond strengths are optimized by a variety of grit-blast profiles. Hospital quality air eliminates surface contamination.

5 The extensive use of robotics and custom tooling maximize coating repeatability.

6 Parts are deburred to prevent coating damage during diamond grinding, handling and assembly.

7 Our QE™ system is so demanding, many of our customers have awarded us "vendor release status," saving them the trouble of further inspection at their plant.

Because General Plasma's QE™ system assures that your coated parts meet or exceed specifications, you can meet your customers' needs, on time, the first time, avoiding the high costs of delays and rejections.

For quality thermal spray coatings you can depend on, specify General Plasma. For quick response, call 1-800-982-0030, or write today.

Comes To The Surface™

Forming n/p Junctions With an Excimer Laser

Compact equipment yields high-quality solar cells.

NASA's Jet Propulsion Laboratory, Pasadena, California

Heating with the concentrated ultraviolet energy of an excimer laser has proved successful in driving liquid dopants into silicon to form shallow n/p junctions for solar cells. The laser equipment is more compact than the furnaces conventionally used to form junctions by diffusion of vapors. The laser equipment can fit on a tabletop.

In preparation for tests of the laser manufacturing technique, liquid dopants were applied to silicon wafers. The wafers were then heated at 200 to 400 °C for 10 to 15 minutes to drive off solvents; the dopants formed hard, glasslike layers. The wafers were then exposed to the excimer laser. Finally, they were metalized.

The excimer laser is a table model that can be pulsed at rates up to 100 Hz. It produces 20 mJ of energy per pulse at a wavelength of 193 or 308 nm (the higher wavelength was used in the tests).

Mirrors directed the light from the laser

to the wafer (see figure). Lenses focused the beam from its original cross-sectional area of 1 cm² to 0.01 cm² at the wafer. The wafer was held in place by a vacuum chuck on a two-stage motorized x-y translation stage. A computer synchronized the motion of the stage with the firing of the laser pulses so that the laser completely scanned the wafer.

The wafers were p-type Czochralski-grown silicon with a <100> crystal orientation, coated on one side with phosphorus-doped liquid to form an n-type layer upon diffusion into the silicon. The wafers were 4 cm² in area; the energy density of the laser beam, 1.2 J/cm²; the duration of the laser pulses, 25 ns; and the beam path overlapped by 50 percent on each pass.

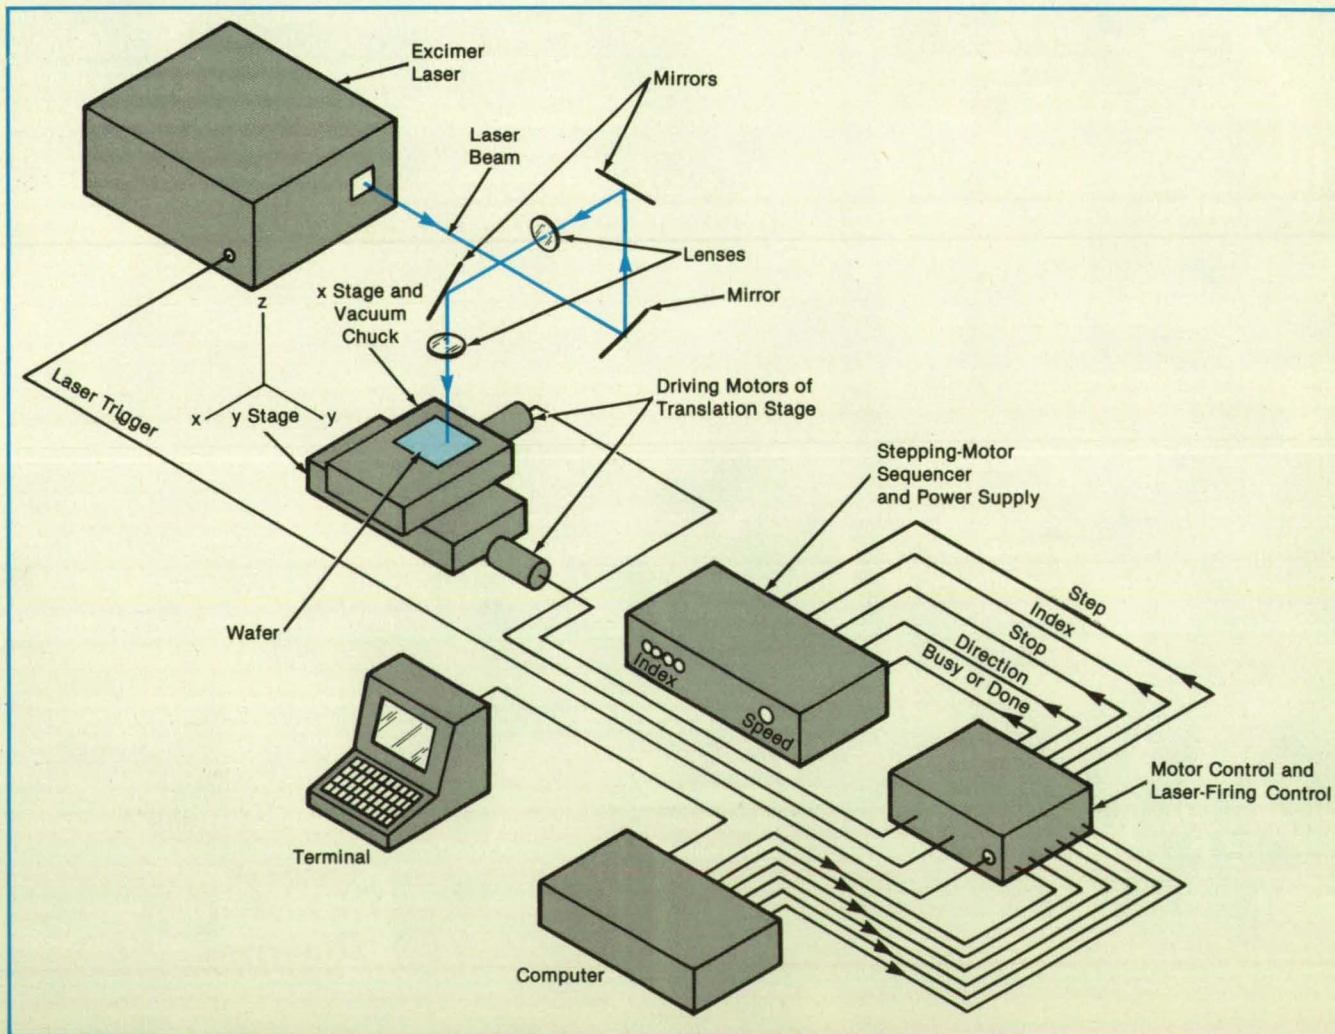

Under these conditions, the system produced solar cells that had an average efficiency of 9.1 percent without an antireflective coating. This is equivalent to over 13 percent efficiency with an antireflective

coating — comparable to that of the best cells made by conventional gaseous diffusion.

The process is also suitable for silicon made by the dendritic-web-growth process. Efficiencies range up to 13 percent with <111> p-type material, 10 cm² in area.

This work was done by Paul Alexander, Jr., of Caltech, Robert B. Campbell of Westinghouse Electric Corp., David C. Wong and William L. Bottenberg of Arco Solar, and Stanley Byron of Spectra-Physics, Inc., for NASA's Jet Propulsion Laboratory. For further information, Circle 19 on the TSP Request Card.

This invention is owned by NASA, and a patent application has been filed. Inquiries concerning nonexclusive or exclusive license for its commercial development should be addressed to the Patent Counsel, NASA Resident Office-JPL [see page 18]. Refer to NPO-16994.

The Computer Controls the Pulses of the excimer laser and the movement of the silicon wafer. The mirrors direct the laser beam to the wafer. The lenses focus the beam to a small spot on the surface.

Shaping Plastic Covers Quickly and Cheaply

A cover of complicated shape can be made in only half an hour.

*Marshall Space Flight Center,
Alabama*

A fixture enables the thermal forming of custom-contoured plastic covers in only half an hour. Previously, two workers needed 12 hours to form such a cover by hand. The fixture is inexpensive and compact.

The fixture (see figure) includes an aluminum baseplate and an aluminum forming plate with an opening cut out to match the cover outline. The pair of plates is mounted on a set of four rods, one rod at each corner of the plates. A spring on each rod pushes the forming plate toward the baseplate.

A wood mandrel is built to match the internal dimensions of the cover. The mandrel is secured to the baseplate and a sheet of plastic is placed on the top of it. The forming plate is placed on the plastic sheet, which may be of a material like acrylonitrile/butadiene/styrene (ABS). The forming plate is spring-loaded against the baseplate.

The fixture and its contents are heated in an oven to soften the plastic, allowing it to deform to the contour of the mandrel. Once the plastic sheet meets and seals against the baseplate due to spring pressure, a vacuum is applied from below to finish the forming operation by forcing the plastic tightly against the mandrel.

Because the mandrel tends to deform in the heat of the oven, it is not used repeatedly. Instead, a new mandrel is made by pouring plaster into the first plastic part made on the wooden mandrel.

This work was done by I. Gurman and D. Muckey of Rockwell International Corp. for Marshall Space Flight Center. No further documentation is available.

Making EDM Electrodes by Stereolithography

Electrodes with complicated shapes are made quickly from computer models.

*Marshall Space Flight Center,
Alabama*

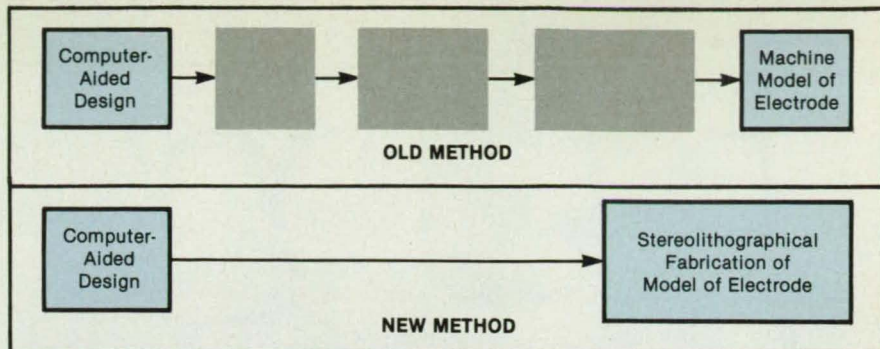

Stereolithography can be used to make models and molds of electrodes for electrical-discharge machining (EDM). By use of stereolithography, an engineer can quickly turn the design of an object into a plastic model, bypassing the machining and other intermediate fabrication steps that normally consume much time (see figure). The technique has been proposed for use in making turbopump impellers for the Space Shuttle main engine and can be used to make EDM electrodes for the manufacture of other objects that have complicated shapes.

Stereolithography is a computer-aided manufacturing technique that is practiced in conjunction with computer-aided design and engineering. The three-dimensional computer model of the surface of the object to be made is converted to vector data, which are passed to the data processor of the stereolithography system. This processor uses the data to control an ultraviolet laser, a galvanometer mirror that scans the laser beam in the x and y (horizontal) directions, and a vertical translation stage in a vat of monomer of a photopolymer below the laser.

The laser beam is focused to a spot in the liquid, causing the monomer to polymerize at that point. The laser beam is scanned across each x-y plane; then the vertical translation stage is moved slightly, and the laser beam is scanned across the next x-y plane. The process continues, gradually building up the model in layers of accreting polymer. Once the model is thus completely grown, it is hardened in a bath of ultraviolet light.

A negative or positive plastic model could be made by this process. A negative model could be used as mold to make positive models, epoxy abrasive dies, or electroformed copper EDM electrodes. It could also be coated with an abrasive and used as an abrasive die to make graphite electrodes. A positive model could be used as a template for tracing by a pantograph or as an injection mold to make EDM electrodes.

*This work was done by Philip A. Barlas of Rockwell International Corp. for Marshall Space Flight Center. No further documentation is available.
MFS-29480*

Stereolithography Eliminates Intermediate Steps in the fabrication of a plastic model of an object to be used in making an EDM electrode to manufacture the object or a mold for the object.

DIVERTING CUP INSTALLED ON STANDARD CUP

DIVERTING CUP IN USE ON WELDING TORCH

The **Stainless-Steel Diverting Cup** shown at the right in the top photograph slips over the standard torch cup as shown in the middle photograph, and the bent electrode is inserted in the torch. The assembly can reach weld joints that are inaccessible to a straight welding torch, as shown in the bottom photograph.

Gas-Diverting Cup for Welding at an Angle

An attachment makes automatic arc welders more versatile.

Marshall Space Flight Center, Alabama

A simple add-on cup for a gas/tungsten arc-welding torch makes it possible to weld in previously inaccessible places. The cup, made of stainless steel, is slipped over a welding torch equipped with a standard No. 10 cup. The add-on cup changes the angle of the gas flow, diverting it 60° away from its usual direction. The tungsten electrode is also bent 60° a short distance from its tip (see figure).

With the add-on cup and the bent electrode, an automatic welding machine can reach joints between protrusions that would interfere with the movement of a straight electrode and gas stream.

*This work was done by G. E. Dyer of Rockwell International Corp. for **Marshall Space Flight Center**. No further documentation is available.*
MFS-29206

Starting VPPA Welds Without Pilot Holes

Welding current is turned on gradually.

Marshall Space Flight Center, Alabama

Variable-polarity plasma-arc (VPPA) "keyhole" welds can be initiated without pilot holes or starting tabs, by use of a simple gradual-turn-on technique. Although pilot holes have typically yielded 80-percent repeatability, tests in the laboratory and in production show that the gradual-turn-on technique is 100 percent reliable.

In VPPA keyhole welding, the welding parameters (standoff distance, voltages or currents, speed of the torch along the weld, and times at the two polarities) are set at values that cause the weld to penetrate the workpiece and the molten metal to flow around the opening in a pattern reminiscent of a keyhole. The conventional method for starting such a weld was to drill a pilot hole to serve as the initial keyhole, carefully align the welding torch over the pilot hole, adjust the standoff distance, and

then turn on the torch at full power. The success of this method depended on the operator's ability to perform this alignment and adjustment precisely.

The new starting technique does not depend on precise manual alignment. The welding torch is positioned with no more than the usual care. As the torch begins to move along the weld, the welding current is gradually increased toward the full operating level, causing the depth of the weld to increase gradually until the keyhole is formed (see figure). The standoff is controlled by the automatic-voltage-control portion of the welding equipment. At the end of a circumferential weld, the torch can continue a short distance past the starting point to overlap and thereby complete the weld in the starting transition region.

This work was done by W. F. McGee of Martin Marietta Corp. for Marshall Space Flight Center. No further documentation is available.

The **Welding Current is increased Gradually** over a short distance until the full operating current is reached, and welding proceeds in the "keyhole" mode.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Marshall

Space Flight Center [see page 18]. Refer to MFS-28268.

Mapping Redistribution of Metal in Welds

Displacements are detected with radioactive tracers.

Marshall Space Flight Center, Alabama

A radioactive-tracer technique can be applied to map the redistribution of metal caused by a welding process. This technique can be used to verify the predictions of computer codes for the dynamics of fluids in weld pools. These codes are important because they contribute to understanding of the dynamics and thereby may help to provide better welds that have lower residual stresses. Before the advent of the new technique, there was no way to verify the predictions of the codes after the completion of welds.

Before welding, the surfaces of the parts to be welded are irradiated by particle-beam generators to make them slightly radioactive to a specified depth in the range of 0.001 to 0.100 in. (0.025 to 2.5 mm). The total radioactivity can be less than 10 μCi — less than the level that requires licensing.

During welding, the radioactive material from the surface layer is churned with the other molten material. Eventually, the radioactive and nonradioactive components solidify in new positions. The new distribution of radioactivity can be imaged by gamma-ray detectors or photographic film. For finer three-dimensional detail, the weld region can be sliced into thin layers prior to imaging.

This work was done by Sarkis Barkhoudarian of Rockwell International Corp. for Marshall Space Flight Center. No further documentation is available.

64 LONGLIB Graphics-Library Program

Application of Prony's Method to Data on Viscoelasticity

The Prony coefficients are found by a computer program, without trial and error.

Marshall Space Flight Center, Alabama

A computational method and computer program have been developed to exploit the full potential of Prony's interpolation method in the analysis of experimental data on the relaxation modulus of a viscoelastic material. Because the relaxation modulus has a component that decays with time, it is well approximated by the first few terms in the Prony series

$$\bar{f}(t) = A + \sum_{i=1}^m B_i C^{\gamma_i t}$$

where $\bar{f}(t)$ denotes the approximation to the true value $f(t)$ of the relaxation modulus (or other quantity) that varies with time, A and the B_i and γ_i are the Prony coefficients that are sought, and t = time.

Typically, experimental values of $f(t)$ are available for discrete times t_k at unequal intervals. Heretofore, there have usually been too many unknowns for the number of data points and equations, making it necessary to solve for A and the B_i by trial and error, using assumed values of the γ_i . Moreover, it has not been possible to exploit the full capabilities of Prony's method because the method, in its traditional form, cannot give the best-fit curve through a set of data unless the data are at equal intervals of time.

In the new method, the first step is to fit the experimental data with a curve composed of a succession of third-degree curves. This is done with the help of the "B-spline interpolation" feature that is incorporated into the Intergraph Interactive Graphics Design System computer pro-

The Prony Interpolation Curve is chosen to give a least-squares best fit to a "B-spline" interpolation of experimental data.

gram. This interpolation is then used to manufacture data at the equal intervals required to obtain the Prony coefficients.

The FORTRAN computer program PRONY calculates the γ_i from the roots of an m th-order equation, the coefficients of which are obtained through a matrix equation in products of differences between equal-interval-interpolated values. Using the calculated values of γ_i , the coefficients A and B_i are then chosen to make the least-squares best fit of the Prony curve to the B-spline curve (see figure).

This work was done by Pedro I. Rodriguez of Marshall Space Flight Center. Further information may be found in NASA TM-86579 [N87-17455/NSP], "On the Analytical Determination of Relaxation Modulus of Viscoelastic Materials by Prony's Interpolation Method."

Three-Dimensional Complex Variables

Recent theoretical advances are reported.

A report presents some results of a new theory of analytic functions of three-dimensional complex variables. Mathematicians have long been frustrated in the search for a three-dimensional system of complex variables that would correspond closely to the well-known two-dimensional complex-number system. While the new three-dimensional system is subject to more limitations and is more difficult to use than is the two-dimensional system, it may nevertheless be useful in the analysis of three-dimensional fluid flows, electrostatic potentials, and other phenomena involving

harmonic functions.

The author defines a three-dimensional complex number $Z = x + dy + ez$, where x , y , and z are customary two-dimensional complex numbers and 1 , d , and e are the basis vectors of the three-dimensional space, with 1 being the identity element of the algebra. The rules of multiplication are defined by

$$\begin{aligned} d^2 &= -\frac{1}{2}(1 + ie), \\ e^2 &= -\frac{1}{2}(1 - ie), \\ de &= ed = -\frac{1}{2}(id) \end{aligned}$$

where $i^2 = -1$. An important property of

MACSYMA DOES THE JOBS EVEN FORTRAN DOESN'T WANT.

Your time is a terrible thing to waste. Cumbersome mathematical models and mind-numbing computations are all part of your job. But the fact is, your real job is to solve problems on a much larger scale, and the pencil pushing is really slowing you down. Even the mainframe can't help, because Fortran just isn't up to the job.

Enter Macsyma, the symbolic mathematics software package that lets you tackle your worst grunt work, in either batch or interactive mode.

Give Macsyma the problems that would keep you busy for days or weeks, and you have your answer in minutes or hours. So you can solve your bigger problems faster. Without wasting a lot of your valuable time.

Dare to tackle problems you could never consider before.

Most of today's complex math modeling is performed using numerical analysis techniques and Fortran. Not necessarily because numerical techniques are appropriate for the job, but because they're appropriate for Fortran.

With Macsyma, though, you can use the best techniques for the task. Macsyma will give you closed-form symbolic solutions, symbolic approximations, and arithmetic solutions as well as numerical solutions. Plots and graphs, too. Without the tedium and errors associated with manual computations. Macsyma will even convert your solutions into Fortran code that can be integrated right into your existing programs.

Try Macsyma for 30 days and discover how much time it can save you every month.

Most professionals never realize how much time they can save until they try Macsyma. So we've made it easy for you. For a nominal installation fee, you can have Macsyma up and running on your VAX, MicroVAX, Sun, APOLLO, or Symbolics system for a 30 day trial.

Put it through the paces. Throw your toughest problems at Macsyma. And when the 30 days are over, you will realize how much more productive you can be with Macsyma handling the math.

For a 30-day trial, or for more information, call 1-800-MACSYMA (in MA, 617-621-7770.) Or write the Computer Aided Mathematics Group, Symbolics, Inc., Eleven Cambridge Center, Cambridge, MA, 02142.

the algebra, therefore, is that all elements commute in multiplication.

The general set of three-dimensional complex numbers is denoted as C_3 . It is also useful to define the more restricted set, C'_3 , for which x , y , and z are real numbers. The author presents several theorems and derivations relating to numbers and functions in C_3 and C'_3 .

An important item concerns the multiplicative inverse, Z^{-1} : one of the peculiarities of this three-dimensional system is that Z^{-1} is undefined for some nonzero values of Z . In C'_3 , it is defined everywhere except along six rays (two of which form the y axis) spaced at equal angles in the plane $x = 0$.

The author defines \bar{Z} , the "bijugate" of Z in C_3 , by the equation

$$\bar{Z} = \frac{1}{2}x - dy - ez$$

The bijugate is somewhat analogous to the two-dimensional complex conjugate. In a theorem that states the necessary conditions for the three-dimensional analyticity of a function $\bar{G} = F(Z)$, the bijugate plays a role analogous to that of the two-dimensional complex conjugate in the Cauchy-Riemann analyticity conditions for two dimensions. Furthermore, as it would be in two dimensions, G is an irrotational and solenoidal vector in three dimensions.

A corollary of the analyticity theorem states that if $\bar{W} = dF/dZ$, then W is also an

irrotational and solenoidal vector. Under suitable conditions, the harmonic real or imaginary parts (in the customary two-dimensional-complex sense) of the components of G can be related to a three-dimensional velocity potential and to general three-dimensional stream functions.

ARC-11756

Integrated Analysis of Static Distributed Systems

An integrated approach encompasses modeling, identification of parameters, estimation of states, and control.

A report discusses aspects of an integrated methodology for the mathematical modeling, identification of parameters, and estimation of the states of a structure or other distributed system, for the purpose of controlling the system. The approach is appropriate for systems in which time-de-

pendent effects are negligible and where control forces can be applied without exciting significant dynamic behavior.

The approach applies to models specified in part by possibly interconnected elliptic partial differential equations for deflections of structures under static loads. The authors cite the example of a wrap-rib antenna equipped with deflection sensors and with actuators that alter its reflecting surface. In this case, the mathematical model also provides for the analysis of measurements of the electromagnetic far field, which is affected by the deflections and can therefore be used to infer the deflections.

Errors in the mathematical model and in the measurements are treated as white noise; this leads to a second-order analysis of the related statistical errors. The identification (that is, the parameter-estimation) techniques are based on the method of maximum likelihood, in which the values of parameters in the mathematical model are obtained by maximizing an appropriately-defined likelihood functional that corresponds to the model equations and that incorporates the measurements. The maximization procedure is based on a Newton iteration of the functional, involving simultaneous approximations in the state and parameter spaces.

The state is estimated by use of a derived conditional mean of the state, given the measurements and parameter values. The resulting estimate is represented as a least-squares superposition of shape functions derived from the model of the structure. Batch processing of different kinds of measurements (e.g., deflections measured at a limited number of points on the antenna or far-field data taken at a finite number of points) yields recursive formulations for the state estimate similar to Kalman gains.

Computer simulations have demonstrated the validity of the general approach. A simplified model of the wrap-rib antenna with 6 actuators and 6, 9, or 12 deflection sensors yielded fairly accurate estimates of the rib-stiffness parameters, with little improvement as the number of sensors was increased. With a simplified planar antenna model, the approach yielded a small spurious deflection in a state-estimation test that used simulated far-field measurements along a ring and simulated electro-optical deflection measurements along a ring and at the center of the antenna surface.

This work was done by Guillermo Rodriguez and Robert E. Scheid, Jr., of Caltech for NASA's Jet Propulsion Laboratory. To obtain a copy of the report, "Integrated Approach to Modeling, Control, Estimation and Identification for Static Distributed Systems," Circle 5 on the TSP Request Card.

SPECIAL OFFER Back Issues of

NASA Tech Briefs ... While They Last

A limited supply of NASA Tech Briefs back issues are now available on a first-come, first-serve basis for only \$10.00 per copy. As a special bonus, order three issues and get a fourth FREE. Order today and discover what you missed in these technology-packed collector editions, each containing over 50 technical reports in 10 subject areas. Highlights include:

1986—
January: Johnson Space Flight Center; Laser Technology
March: Voyager 2; New Ceramics; Wind Tunnel Testing
May: Magnetic Resonance Imaging; Solar Power
July: Kennedy Space Center; Advanced Polymers
September: Report Of The National Commission On Space; Mobile Communications
November: Computer Previews; Ada Report; Artificial Intelligence

1987—
February: Goddard's Massively Parallel Processor; X-Ray Imaging
March: Technology For Stars & Stripes Racing Yacht; Materials Research At Lewis
April: VLSI Advances; Image Processing
May: Sensor Technologies; New Composites
June: Advanced Lasers; Nondestructive Testing
July: Remote Sensing; New Airfoils; Tech Careers
October: Space Station; Robotics; Computer Aided Design

Remember: For every three copies you order take a fourth ... absolutely FREE!

Enclosed is my check for \$_____ for the following issues: (please indicate quantity)

Fuel your imagination.

Your imagination is limited only by practical considerations. Materials. Technologies. Costs. That's why coming to Fall Design can make a crucial difference.

You'll expand your knowledge — and save time, too. Because Fall Design puts you in touch with more technical experts, and more new products than you could evaluate in months at your office.

You can further increase your expertise with courses at the ASME-sponsored Conference.

Spend a day at Fall Design and you'll come away stimulated. Refreshed. Equipped with the information you need to fuel your imagination. So that you can turn design projects into successful products.

98 Lightweight Helmet for Eye/Balance Studies
98 Food-Growing, Air- and Water-Cleaning Module

99 Three-Dimensional Ultrasonic Imaging of the Cornea

Lightweight Helmet for Eye/Balance Studies

A bite board, sized liners, and inflatable bladders fix the helmet to the head.

Lyndon B. Johnson Space Center, Houston, Texas

A comfortable lightweight helmet serves as a mounting platform for stimulus and sensor modules used in experiments on the role of the vestibulo-ocular reflex in motion sickness and space-adaptation syndrome. These experiments require prevention of relative motion between the subject's head and the helmet-mounted modules. To achieve this without discomfort to the subject, the helmet has a fitted liner and five inflatable air bladders that stabilize the helmet with respect to the subject's head. A personal bite board attached to a chin-bar assembly makes the hard palate in the subject's mouth serve as a final position reference for the helmet.

The new helmet replaces a heavier metal helmet that was cumbersome and very uncomfortable. To prevent relative movement between helmet and head, that helmet used padded screws that pressed against the subject's head — a fixation technique that adversely affected both data collection and the subject's mental attitude.

The new helmet is easy to put on and take off. Its relatively low cost and simple manufacturing process make it attractive for a variety of neurosensory investigations. It is easily adapted to different

wearers and experiments.

The new helmet is made of a lightweight polyethylene material (Spectra 900 or equivalent), fiberglass, and layers of graphite fibers. Without modules or accelerometers, it weighs less than 4 lb (1.8 kg). Low weight is necessary to reduce changes in reflexes caused by forces on head and neck muscles. Even when using the helmet in zero gravity, low mass is necessary to minimize inertia.

Because some of the experiments done with the helmet can cause motion sickness, a bite-board rapid-removal system is included as a safety measure. Pulling on a release cord detaches the lower front portion of the helmet and the bite board so that the subject can remove the helmet rapidly.

The helmet has quickly- and easily-operable electrical and mechanical connectors to facilitate interchangeability of the stimulus and sensor modules. Each module includes the male portion of a Hasselblad (or equivalent) bayonet camera mount. Female portions of the bayonet mounts are mounted on the visor of the helmet so that the modules can be mounted in front of the subject's eyes. Flattened areas on the top, back, and sides of the helmet allow for the mounting of accelerometers and other

mechanical connections for sensing the position and acceleration of the head. Instructions can be communicated to the subject via headphones mounted in the helmet lining. A foam pad at the nose and cheeks prevents unwanted stimulation of the subject by outside light.

Thus far, stimulus and monitoring devices that have been mounted on the helmet include the following:

- Accelerometers to measure the acceleration of the head;
- Video cameras to record eye movements;
- An optokinetic stimulus module;
- Various light filters, including complete occlusion; and
- Calibration modules for electro-oculargrams.

This work was done by M. Catherine McStravick, David R. Proctor, and Scott J. Wood of Technology Inc. for Johnson Space Center. No further documentation is available.

This invention is owned by NASA, and a patent application has been filed. Inquiries concerning nonexclusive or exclusive license for its commercial development should be addressed to the Patent Counsel, Johnson Space Center [see page 18]. Refer to MSC-21249.

Food-Growing, Air- and Water-Cleaning Module

An apparatus produces fresh vegetables and removes pollutants from the air.

Lyndon B. Johnson Space Center, Houston, Texas

A hydroponic apparatus performs the dual function of growing fresh vegetables and purifying air and water. The system was developed for the production of salad vegetables in microgravity during long Space Shuttle missions and for experimentation with the recycling of air and water. The concept may be adaptable to the production of food and the cleaning of air and water in such closed environments as those in underwater research stations and submarines.

The apparatus is housed in a shell designed to fit in a locker (see figure). Fluores-

cent lamp tubes provide light. Fans circulate air from the cabin through the shell; besides providing one of the ingredients for photosynthesis, the flowing air cools the lamps. The vegetable leaves remove carbon dioxide from the air as they photosynthesize carbohydrates.

The walls of the shell hold a soillike growth medium, a granular calcined clay with particles ranging in size from 1 to 2 mm. The medium supports the plant roots; holds water, nutrients, and useful microbes; and allows the exchange of ions.

An aeration subsystem draws air

through the growth medium and roots. It serves to remove excess water in the capillaries of the medium, bring fresh oxygen into the root zone, and bring organic pollutants into contact with microorganisms that feed on them.

An "on-demand" watering subsystem supplies water and nutrients in quantities just sufficient for the needs of the roots. It fills the small capillaries adjacent to the roots but leaves the large capillaries clear for the movement of air. The subsystem may be active, employing moisture sensors, feedback circuits, and pumps; or it

may be passive, depending entirely on the capillary properties of the growth medium. A control module contains electronic circuitry that regulates the lighting cycle, the aeration of roots, and the supplies of water and nutrients.

Many variations of the system are possible. For example, it can be modified to accommodate such tall plants as dwarf tomato or bell pepper instead of such short ones as lettuce. In this case, the growth medium would occupy only one wall of the shell instead of two walls. The lamp tubes would be placed on the opposite wall instead of in the center. In another variation, the growth medium would be plastic foam incorporating ion-exchange resin beads as the supply of nutrients.

This work was done by R. L. Sauer of Johnson Space Center and H. W. Scheid and J. W. Magnuson of PhytoResource Research, Inc. For further information, Circle 122 on the TSP Request Card.

Inquiries concerning rights for the commercial use of this invention should be addressed to the Patent Counsel, Johnson Space Center [see page 18]. Refer to MSC-21301.

Leafy Vegetables rooted in a granular growth medium grow in the light of fluorescent lamps. Air flowing over the leaves supplies them with carbon dioxide and receives fresh oxygen from them.

Three-Dimensional Ultrasonic Imaging of the Cornea

A proposed technique would generate pictures of curved surfaces.

NASA's Jet Propulsion Laboratory, Pasadena, California

A concept for creating three-dimensional ultrasonic images would give images of such small curved objects as the cornea for medical diagnoses. The concept is adaptable to other types of reflection measurement systems as well — sonar and radar, for example.

The usual ultrasonic scanning along perpendicular x and y axes can be supplemented by gating the receiver to obtain information about small variations in depth (see figure); i.e., the receiver is held on for a brief "window" period for each reflected sound pulse. The window extends from slightly before to slightly after the expected time of return of a transmitted sound pulse. Variations in the elapsed time between transmission and reception correspond to variations in range of the target surface. These variations can be converted by time-delay spectrometry to depth variations over the cornea.

The depth variations can be displayed in any of several ways:

- As shades of gray on a video screen;
- As changing colors on a color screen; or
- As a stereoscopic image. For this presentation, two ultrasonic transmitter/receivers would be positioned to represent the left and right eyes. Their separate displays

could be viewed through polarizers simultaneously so that the observer would experience visual sensations of depth variation.

This work was done by Richard C. Heyser and James A. Rooney of Caltech for NASA's Jet Propulsion Laboratory. For further information, Circle 41 on the TSP Request Card.

In accordance with Public Law 96-517, the contractor has elected to retain title to this invention. Inquiries concerning rights for its commercial use should be addressed to

Edward Ansell
Director of Patents and Licensing
Mail Stop 301-6
1207 East California Boulevard
Pasadena, CA 91125

Refer to NPO-16570, volume and number of this NASA Tech Briefs issue, and the page number.

An Object Is Ultrasonically Scanned in a raster pattern generated by a scanning transmitter/receiver. Meanwhile, the receiver is turned on at frequent intervals to measure depth variations of the scanned object.

New Literature

A new four-color reference guide to **vacuum technology** is available free of charge from Balzers, Hudson, NH. The 40 page handbook emphasizes the principles, types, applications, modes of operation, and design fundamentals of turbomolecular pumps. A "design fundamentals" section includes formulas for calculating resistance and conductance, effective volume flow rate for geometrical configurations, and pump-down times. **Circle Reader Action Number 724.**

A new brochure from CIDTEC Inc., Liverpool, NY, includes complete product specifications for CIDTEC's CID2710 **video camera**. The four-page brochure describes the camera's antiblooming and command stop motion capabilities, and discusses potential applications, including industrial inspection and testing, military guidance and tracking, and medical imaging. **Circle Reader Action Number 730.**

"CADAM Step By Step," a self-training book for **learning CADAM software**, is available from CAD/CAM Consulting, Chicago, IL. The book contains 12 lessons featuring more than 300 illustrations. No previous computer knowledge is required. **Circle Reader Action Number 728.**

Future Technologies Inc., Madison, GA, has published a **Survey on High-Temperature Superconductor Applications** that provides a timetable for superconductor product development, based on the combined forecasts of leading U.S. superconductivity experts. The commercialization and economic impact of high-temperature superconductors are projected for 28 classes of electronic, magnetic, communications, transportation, industrial, and power generation products. **Circle Reader Action Number 714.**

A new brochure from Vanzetti Systems, Stoughton, MA, highlights 11 non-contact **infrared temperature sensing and control products**. The brochure describes Vanzetti's infrared temperature transmitters, detector heads, infrared temperature monitors, signal processors, and linearized head assemblies. **Circle Reader Action Number 722.**

Omega Engineering Inc., Stamford, CT, has released a new **Data Acquisition and Computer Interface Handbook**. Available free of charge, the handbook features over 350 full color pages describing hundreds of products from **software to complete data acquisition systems**. Included are sections on communication-based acquisition systems, data acquisition software, plug-in cards, industrial process controls, data logging systems, signal conditioners, recorders, printers, and plotters. **Circle Reader Action Number 718.**

Electroid Company, Springfield, NJ, is offering a free four-color brochure entitled "Aerospace Components for Motion Control" which illustrates various torques and sizes of **electromagnetic clutches, couplings, brakes, and solenoids**. **Circle Reader Action Number 726.**

A free brochure offered by Integrated Computer Systems, Culver City, CA, describes nine **technical short courses** for managers in technical environments. The courses cover topics in management skills, finance, managing projects, managing people in technical environments, and business skills. **Circle Reader Action Number 716.**

The Ceramic to Metal Component Catalog published by Ceramaseal, New Lebanon, NY, illustrates new **vacuum products** for high-temperature, high-vacuum, cryogenic, and superconducting environments. The four-color catalog describes Ceramaseal's full line of feed-thrus, connectors, thermocouples, and view-ports. **Circle Reader Action Number 706.**

Over 3,000 **linear, rotational, and elevational motion devices and systems** are illustrated in a new catalog from the Klinger Scientific Corp., Garden City, NY. The catalog also features a technical explanation of micropositioning theory and technologies. **Circle Reader Action Number 704.**

Hewlett-Packard's newly revised **Fiber Optics Handbook** highlights the latest technical developments in the photonics industry. The 250 page handbook is organized alphabetically and features many cross-references. **Circle Reader Action Number 702.**

A free catalog from Grayhill Inc., La Grange, IL, illustrates the company's full line of **switches, keyboards, relays, and I/O modules**. Military qualification and UL and CSA recognition are listed for applicable DIP, rotary, and pushbutton switches, as well as solid state relays and I/O modules. **Circle Reader Action Number 712.**

A free brochure from the Soltec Corp., San Fernando, CA, spotlights Soltec's new **DS-8000 Digital Servo Recorder**. Unlike most strip chart recorders, the DS-8000 contains a microprocessor that converts all analog signals to a high-resolution, digital format. **Circle Reader Action Number 708.**

New on the Market

ISCAN Inc., Cambridge, MA, has introduced the **OPTIMOUSE™**, a **remote control cursor system** designed for rapid computer data entry. The OPTIMOUSE consists of a miniature real-time digital image processor that automatically tracks the position of a handheld pointer. The pointer can interface with any computer to control cursor position on the computer's video terminal. Unlike conventional mouse, trackball, or tablet data entry devices, the OPTIMOUSE has no desktop footprint and requires no physical contact with the computer system.

Circle Reader Action Number 800.

TCI Software Research Inc., Las Cruces, NM, has developed the **T³ Scientific Word Processing System**, a technical document preparation program for IBM PCs and compatibles. Using a menu-driven interface and graphics screen display, T³ offers a simple way to produce documents containing complex expressions. Mathematics, chemical structures, foreign languages, and other special characters are entered directly with T³; no command language or mark-up code is required. Features include a built-in spelling checker, proportional and fixed character spacing, user-defined line and page formatting, and a macro capability.

Circle Reader Action Number 776.

The **SPEECH THING™** from Covox Inc., Eugene, OR, is an eight bit digital-to-analog **sound converter** that attaches in-line with the parallel printer port of an IBM PC/XT/AT or compatible, allowing the computer to reproduce high-fidelity speech and music. Software includes a talking calculator, a graphics-based sound editor, a music sampler keyboard, and a special effects control panel. The complete hardware/software speech system costs \$69.95.

Circle Reader Action Number 762.

Showcase Systems Inc., Belmont, CA, has unveiled the Showcase Display Processing Workstation, a large screen (24"x36") **digitizing drawing table** that combines a stylus or cursor with a high-resolution computer-generated color image. The image appears directly on the surface of the drafting table, thereby eliminating the "hand-to-eye" problem of using a cursor/mouse and monitor. Applications include design, control, and simulation.

Circle Reader Action Number 794.

A new MicroVAX and VAXstation 3XXX-compatible **memory series** consisting of 8, 16, and 32 megabyte boards has been introduced by Clearpoint Research Corp., Hopkinton, MA. Using a custom gate array design, Clearpoint's MV3000 delivers 32 or 16 megabytes of memory using one megabit DRAMs. The MV3000/8MB uses 256 Kbit ZIP DRAMs. The MV3000 can also be used by MicroVAX II customers who upgrade their CPU boards to the MicroVAX 3000.

Circle Reader Action Number 780.

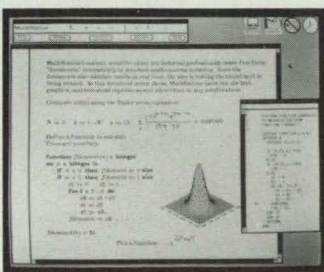

CHR Industries Inc., New Haven, CT, is offering for evaluation a free sample of the company's new low-density **silicone foam**. The COHRLastic® foam material provides broad chemical and environmental resistance, low-compression set, and densities as low as 11 pounds/cu. ft. Applications include thermal barriers, noise and vibration dampeners, insulation, gaskets, and seals.

Circle Reader Action Number 784.

The **XPD-700 X-ray Diffractometer** from Siemens Analytical X-ray Instruments Inc., Madison, WI, offers enhanced beam brilliance, sample orientation, and x-ray detectability over previous micro-diffraction methods. The system couples dual nickel-coated x-ray mirrors for beam focusing and monochromatization. Sample orientation is achieved via a three-axis camera.

Circle Reader Action Number 786.

MathSoft Inc., Cambridge, MA, has introduced **MathStation™**, an interactive **software tool** used to design and build mathematical models and to perform numerical analysis. MathStation allows users to work directly with mathematics and spend less time programming. The workstation software integrates mathematics, text, and graphics with a WYSIWYG display, generates FORTRAN automatically from mathematical models, and integrates with existing FORTRAN code and libraries.

Circle Reader Action Number 770.

Tribo/Comp™ TFD, a new self-lubricating **composite material** produced by the Tiodize Company, Huntington Beach, CA, offers a strength-to-weight ratio which is one-fifth the weight of steel and one-half the weight of aluminum. The three-dimensional graphite fiber composite exhibits a .04 friction coefficient with no creep when exposed to 30,000 PSI compressive loads at 600°F continuously. Tribo/Comp TDF can be processed into a variety of shapes, including aircraft fasteners, bearings, gears, and fittings.

Circle Reader Action Number 772.

Dianachart Inc., Rockaway, NJ, has introduced an **XT Turbo Computer** for harsh industrial environments. The 19 inch rack-mounted computer is enclosed in a sealed metal case that maintains positive pressure against dirt and dust. Air is drawn into the case through a replaceable filter. 640K memory, parallel and serial ports, and a 5-1/4 inch floppy disk are standard.

Circle Reader Action Number 760.

The new **8400 Digital Pressure Measurement System** from Pressure Systems, Hampton, VA, allows users to digitally program calibration pressures in real time for on-line calibration of PSI's electronic pressure scanners. In addition to pressure scanning, the 8400 can measure extraneous parameters such as temperature and flow. The unit's parallel processing design permits acquisition rates up to 400,000 measurements per second.

Circle Reader Action Number 777.

The **QL3600 Laser/Microcomputer Pyrometer** from Quantum Logic Corp., Hackensack, NJ, automatically measures total radiance and reflectivity or true temperatures of diffuse surfaces in research and industrial control applications. Absolute accuracies of +5°F are attainable, with various ranges available to cover 840-5430°F. An on-board digital link transfers either emissivity-corrected temperatures or target radiance and in-situ reflectivity data to an external computer for data acquisition, analysis, and presentation. Analog output options are available.

Circle Reader Action Number 758.

New on the Market (continued from previous page)

A free demonstration disk of MINI-GAM II, a menu-driven software package for gamma spectroscopy with high-purity germanium detectors, is now available from EG&G Ortec, Oak Ridge, TN. The sample is offered on either 3½ inch or 5¼ inch, double-sided, double-density diskettes, and is accompanied by a text of walkthrough instructions.

Circle Reader Action Number 782.

Six new SolderQuik® tapes from the Raychem Corp., Menlo Park, CA, align and precisely deliver solder to a variety of surface-mount components. The tapes are suited for soldering of leaded chip carriers and edge connectors to printed wiring boards, as well as soldering of flat packs, jumpers, and flexible circuits. With the proper reflow equipment, the tapes can virtually eliminate bridging.

Circle Reader Action Number 774.

The new Antares™ Q-switched, modelocked Nd:YAG laser from Coherent Inc., Palo Alto, CA, provides the highest pulse energy and repetition frequency of any commercially available laser system. The Antares Model 7800 delivers 4 mJ Q-switched at 1064 nm; 3 mJ Q-switched and modelocked at 1064 nm; and 1 mJ at 532 nm. In Q-switched CW operation, the Model 7800 offers selectable pulse repetition rates from 10 Hz to 20 KHz, using a built-in digital display.

Circle Reader Action Number 798.

A new millimeter-wave power meter from the Dorado Company, Seattle, WA, can measure power from 26.5 to 170 GHz with a single sensor. The Dorado Model PS-28-6 can take up to 1.5 watts CW without burnout and measure pulse signals up to 100 watts peak.

Circle Reader Action Number 778.

The new CIR-KIT® from Pace Inc., Laurel, MD, offers a low-cost way to quickly repair and/or replace damaged or missing lands, conductors, and edge connectors on printed circuit boards. Each kit contains over 30 sizes of eyelets, tracks of various widths, an abrasive stick, a setting tool, and instructions.

Circle Reader Action Number 752.

The new Series 15, ¾" round keylock concept created by EAO Switch Corp., Milford, CT, offers the design engineer a low-cost, five tumbler lock mechanism with a choice of contact materials and standard EAO switch elements. The Series 15 gives the engineer the flexibility to design-in an assembled, two-position keylock with the exact power requirements for the application.

Circle Reader Action Number 764.

The Monarch Color Graphics Converter (CGC) from Folsom Research Inc., Folsom, CA, converts high-resolution black and white or color computer graphics to NTSC or PAL format in real-time, for use with video recorders, projectors, and video disks. The Monarch CGC accepts either interlaced or non-interlaced graphics output video at a horizontal scan frequency of up to 72 KHz and a maximum of 1024 active lines. Applications include CAD/CAM/CAE, animation, and marketing and commercial television presentations.

Circle Reader Action Number 796.

Two new series of fiber optic transmitters and receivers in a fiber-DIP plastic package have been developed by the Optoelectronics operation of Micro Switch, a Honeywell division. The Honeywell HFE4400 series offers a wide range of minimum output power for standard 850 nm LEDs, while the Honeywell HFD3400 series are fiber optic receivers ranging from 5 Mbit direct-coupled integrated receivers to 35 MHz analog integrated receivers. Both series come with an optical connector that accepts standard 905- or 906-type SMA fiber optic connectors.

Circle Reader Action Number 768.

Scanivalve Corp., San Diego, CA, has introduced the Hyscan™ 2000 Pressure Measurement System, a PC/AT-based data acquisition system that scans and stores pressure and analog input signals at 100,000 channels per second. Engineering unit converted data can be downloaded to a host computer at throughput rates up to 50,000 measurements per second. Unlike other pressure data systems available today, the Hyscan 2000 is both a high-speed computer and a pressure measurement system. The DAQ provides processing power with either the 80286 or 80386 CPU.

Circle Reader Action Number 792.

New SONEX Juniors from Illbruck, Minneapolis, MN, are designed to control noise problems in the office, plant, warehouse, or home. The sculptured panels, each 24" square and 2" thick, feature a porous acoustic construction that helps alleviate such common sound problems as standing waves, slap echo, and peak resonances. SONEX Juniors can be arranged in a uniform pattern or at various angles for design versatility.

Circle Reader Action Number 766.

A new thermoplastic powder prepreg process that can combine virtually any polymer with any reinforcement has been developed by Thermoplastic Composites, an operating unit of BASF Structural Materials Inc., Charlotte, NC. The solvent-free process eliminates the need for lengthy mold cycle times, concerns over void formation, and the problems associated with solvent removal. The powder preform is presently available as unidirectional tape. Products under development include single-end towpreps, unidirectional broad goods, and woven fabric.

Circle Reader Action Number 788.

Intech, Fort Lee, NJ, is offering samples of its new Power Core™ composite material, designed to solve noise, vibration, corrosion, and alignment problems in gear applications. Power Core machinable blanks are cast of Lauramid®-nylon 12 around a hexagonal metal core to assure high torque delivery at elevated temperatures.

Circle Reader Action Number 748.

The new HC-4000 Holographic System from Newport Corp., Fountain Valley, CA, provides real-time holographic data for non-destructive testing and evaluation. Using a compact on-board laser diode source and a CCD camera, the HC-4000 records holograms every 1/30 of a second and produces deformation measurements accurate to half the wavelength of light.

Circle Reader Action Number 750.

ARE YOUR IDEAS AHEAD OF OUR TIME?

Stonehenge, one of the most famous of all the classical megalith monuments, has long been an important part of the popular and scientific imagination. Its origin has been the cause of speculation for years, as scientists try to discern who had the intellect and ingenuity to create a celestial observatory of such astronomical significance and exactness.

What is clearly understood and shared these 4,000 years later is man's unceasing fascination with the heavens and his need to explore them for a better understanding of his place in time and space.

The construction of Stonehenge required remarkable genius and ability — and so will the endeavors we have planned at General Dynamics Space Systems Division.

You can now be a part of our exciting time in history. Your ideas and accomplishments could be chronicled for future generations to study as hallmarks of a brilliant epoch in space exploration.

We currently have opportunities available in the areas listed below for individuals with a technical degree or the equivalent combination of formal education and related experience. Government or aerospace industry background is preferred. If you are interested in one or more of these areas, please send your resume to: Professional Staffing, GENERAL DYNAMICS SPACE SYSTEMS DIVISION, MZ C2-7143-I255, P.O. Box 85990, San Diego, CA 92138.

(Opportunities also exist in Huntsville, AL and Harlingen, TX.)

AVIONICS

- EMI/EMC
- Electrical Power
- Instrumentation
- RF Systems
- Parts Engineering
- Harness Design/Installation
- Liaison
- Analog/Digital Circuit Design
- Avionics Systems
- Mechanical Packaging
- Control Systems
- Guidance & Navigation

QUALITY ENGINEERING

- Tool Design/Proofing
- Software Quality Assurance
- Process Control
- Radiographic Inspection

FLUID SYSTEMS DESIGN

- Pneumatic
- Hydraulic
- Propulsion
- Cryogenics

STRESS ANALYSIS

- Hand Analysis
- Finite Element Modeling
- Structural Test Support
- CAE
- Methods
- Advanced Composites

SYSTEMS

- Systems Requirements
- Systems Safety
- Environmental Engineering
- Security Engineer
- Software

STRUCTURAL DESIGN

- Advanced Composite Structures
- Tank Structures
- Adapters
- Fairings
- Materials & Processes
- Pre-Design
- Mechanical Liaison
- Superconducting Magnets
- Drawing Checkers

DYNAMICS/ANALYSIS

- Launch Vehicle Transient Load
- Environmental Dynamics
- Acoustics
- Jettison Trajectory
- IRAD & CRAD
- CAE

THERMAL/FLUIDS ANALYSIS

- Systems Modeling
- Space Environments
- Propulsion
- Cryogenics

TEST & EVALUATION

Choose From An Exciting Selection of NASA Bestsellers

Quest For Performance: The Evolution Of Modern Aircraft

Richly detailed history of the airplane's development, filled with color and bw photos of aircraft from the early years to modern times. Must reading for aviation enthusiasts! 561 p. (\$29.95)

NASA 1958-83: Remembered Images

From Project Mercury to the Space Shuttle, this stunning full-color book chronicles NASA's first 25 years in space. 136 p. (\$24.95)

Living And Working In Space: A History Of Skylab

A comprehensive history of Skylab, America's first space station. Includes astronauts' bibliographies. Color ill. 470 p. (\$23.95)

Apollo Expeditions To The Moon

Dazzling color volume illustrates the entire 15-year Apollo program. Written by 18 key members of the Apollo team. Clothbound. 313 p. (\$21.95)

Selections From The NASA Art Collection

A portfolio of 12 color lithographs of artworks by well-known artists, suitable for framing. Subjects include Shuttle launches and landings, experimental aircraft, satellites, and deep-space probes. 11x14 inches (each) Shipped flat. (\$12.95 for the complete set)

Space-Based Remote Sensing Of The Earth

Reports new research in remote sensing of our land, oceans, and the atmosphere. Many color photos. 151 p. (\$12.95)

Leadership And America's Future In Space

Astronaut Sally Ride's long-awaited report details the strategies needed to regain U.S. space leadership. Full-color ill. (\$11.95)

Selling To NASA

This colorful NASA publication gives potential contractors tips on product marketing and government procurement. Includes postcards for bidder's mailing list application forms. 44 p. (\$9.95)

Rush me: (indicate quantity)

Subject Index

A

ABRASIVES

Erosion-resistant water-and-grit-blasting assembly page 83 MFS-28219

ACTUATORS

Rotary joint for the space station page 82 LEW-14542

AIRCRAFT CONTROL

Yaw control at high angles of attack page 76 LAR-13472

AIRFOILS

Divergent-trailing-edge airfoil page 66 LAR-13374

ALUMINUM ALLOYS

Powder-metallurgy process and product page 60 LAR-13451

ANNEALING

Annealing reduces free volumes in thermoplastics page 54 LAR-13664

ARC WELDING

Gas-diverting cup for welding at an angle page 92 MFS-29206

ATMOSPHERIC MODELS

Four-dimensional global reference-atmosphere model page 62 MFS-28293

AUTOMOBILE ENGINES

Choosing an alloy for automotive Stirling engines page 61 LEW-14609

AVALANCHE DIODES

Solid-state single-photon counter page 27 NPO-17103

B

BATTERY CHARGERS

Integrated inverter and battery charger page 26 NPO-17133

BOUNDARY LAYER TRANSITION

Laminar-separation sensor page 72 LAR-13463

C

CEPSTRAL ANALYSIS

Cepstral analysis detects ball-cage wear page 80 MFS-29187

CERAMICS

Artificial voids in ceramic materials page 56 LEW-14586

Organoborosilane polymers and ceramic products page 58 ARC-11649

CHLOROPRENE RESINS

Effects of radiation on elastomers page 60 NPO-16747

CIRCUITS

Switching voltage regulator page 20 NPO-16889

COAXIAL PLASMA ACCELERATORS

Arc plasma gun with coaxial powder feed page 86 LEW-14539

COMPLEX VARIABLES

Three-dimensional complex variables page 94 ARC-11756

COMPUTER GRAPHICS

LONGLIB graphics-library program page 64 NPO-17443

COMPUTER NETWORKS

Asynchronous communication scheme for hypercube computer page 31 NPO-16860

COMPUTERIZED SIMULATION

Simulating line-of-sight radar returns page 36 ARC-11783

COMPUTERS

Microcomputer board for space shuttle payloads page 40 GSC-13143

CONCURRENT PROCESSING

Asynchronous communication scheme for hypercube computer page 31 NPO-16860

CONTAINERLESS MELTS

Furnace for rapid melting and freezing page 44 MFS-28195

CORNEA

Three-dimensional ultrasonic imaging of the cornea page 99 NPO-16570

COSMIC DUST

Detecting space-dust particles page 52 LAR-13392

COUNTERS

Solid-state single-photon counter page 27 NPO-17103

COUPLING CIRCUITS

Contactless coupling for power and data page 22 GSC-13059

CRYOGENIC COOLING

Status of sorption cryogenic refrigeration page 53 NPO-17349

CRYOGENIC FLUIDS

Seals for cryogenic turbomachines page 82 LEW-14556

CRYSTAL DEFECTS

Temperature fluctuations during crystal growth page 48 LAR-13670

CRYSTAL GROWTH

Temperature fluctuations during crystal growth page 48 LAR-13670

D

DETECTING

Multiple-coil, pulse-induction metal detector page 24 KSC-11386

DETECTION

Detecting space-dust particles page 52 LAR-13392

DIGITAL DATA

Contactless coupling for power and data page 22 GSC-13059

DISCS (SHAPES)

Predicting life and reliability of a rotating disk page 80 LEW-14582

DISPLAY DEVICES
Force-balance dynamic display
page 32 LAR-13658

DISTRIBUTED PARAMETER SYSTEMS
Integrated analysis of static distributed systems
page 96 NPO-17010

DRILLING
Laser micromachining in a reactive atmosphere
page 84 NPO-16587

DUST
Detecting space-dust particles
page 52 LAR-13392

E
ELASTOMERS
Effects of radiation on elastomers
page 60 NPO-16747

ELECTRIC BATTERIES
Bipolar-battery construction
page 30 NPO-15315

ELECTRIC MOTORS
Self-centering reciprocating-permanent-magnet machine
page 74 LEW-14263

ELECTRODES
Making EDM electrodes by stereolithography
page 91 MFS-29480

Repair of graphite EDM electrodes
page 86 MFS-29138

EXCIMER LASERS
Forming n/p junctions with an excimer laser
page 88 NPO-16994

F
FABRICATION
Bipolar-battery construction
page 30 NPO-15315

Shaping plastic covers quickly and cheaply
page 90 MFS-29188

FLAT PLATES
Contactless coupling for power and data
page 22 GSC-13059

FRAGMENTS
Multiple-coil, pulse-induction metal detector
page 24 KSC-11386

FUNCTIONAL ANALYSIS
Three-dimensional complex variables
page 94 ARC-11756

FURNACES
Furnace for rapid melting and freezing
page 44 MFS-28195

G
GAMMA RAY ABSORPTIOMETRY
Mapping redistribution of metal in welds
page 93 MFS-29487

GAS TUNGSTEN ARC WELDING
Gas-diverting cup for welding at an angle
page 92 MFS-29206

GRAPHITE
Repair of graphite EDM electrodes
page 86 MFS-29138

H
HEAT RESISTANT ALLOYS
Choosing an alloy for automotive Stirling engines
page 61 LEW-14609

HELMET MOUNTED DEVICES
Lightweight helmet for eye/balance studies
page 98 MSC-21249

HIGH TEMPERATURE FLUIDS
Stabilizing PFAE against oxidation
page 56 LEW-14612

HISTOGRAMS
LONGLIB graphics-library program
page 64 NPO-17443

HYDRAULIC FLUIDS
Stabilizing PFAE against oxidation
page 56 LEW-14612

HYDRAULIC JETS
Erosion-resistant water-and-grit-blasting assembly
page 83 MFS-28219

Erosion-resistant water-blast nozzle
page 83 MFS-28218

HYDROPONICS
Food-growing, air- and water-cleaning module
page 98 MSC-21301

I
IMAGING TECHNIQUES
Three-dimensional ultrasonic imaging of the cornea
page 99 NPO-16570

INFRARED SPECTROMETERS
Stand for infrared multiple-internal-reflection mount
page 44 LAR-13610

INVERTERS
Integrated inverter and battery charger
page 26 NPO-17133

IRON ALLOYS
Choosing an alloy for automotive Stirling engines
page 61 LEW-14609

J
JET FLOW
Erosion-resistant water-blast nozzle
page 83 MFS-28218

JOINTS (JUNCTIONS)
Improved robot-joint calculations
page 79 LAR-13682

L
LAMINAR FLOW
Laminar-separation sensor
page 72 LAR-13463

LASER APPLICATIONS
Laser pyrometer for spot temperature measurements
page 48 NPO-17024

LASER CUTTING
Laser micromachining in a reactive atmosphere
page 84 NPO-16587

LIFE (DURABILITY)
Dry PMR-15 resin powders
page 58 LEW-14573

LIGHT ALLOYS
Powder-metallurgy process and product
page 60 LAR-13451

LINE OF SIGHT
Simulating line-of-sight radar returns
page 36 ARC-11783

LINEAR SYSTEMS
Self-centering reciprocating-permanent-magnet machine
page 74 LEW-14263

LOADING OPERATIONS
Gravity compensation technique uses small dc motor
page 78 ARC-11525

LOW GRAVITY MANUFACTURING
Furnace for rapid melting and freezing
page 44 MFS-28195

M
MACHINING
Laser micromachining in a reactive atmosphere
page 84 NPO-16587

If you can make it to only one U.S. Government computing event this year . . . make it this one!

Aerospace & Defense Computing

September
20-22, 1988

The Los Angeles Airport Hilton Hotel
Los Angeles, California

THREE-DAY CONFERENCE AND EXPOSITION

ADC '88 Exposition will feature 100 exhibits from select manufacturers of:

- Supercomputers
- Al/Neural Networks
- Ruggedized and Fault Tolerant Systems
- Workstations
- Ada
- CAD/CAM
- Graphics/Imaging

Manufacturers include:

• H-P • Raytheon • Cray • DEC • Prime • AT&T • Sun • Convex • G.E.

ADC '88 Three-day executive conference and technology forum for:

- THE NEW GENERATION COMPUTING; HOW IT CONVERGES WITH MILITARY AND SPACE NEEDS,
- ADVANCE ARCHITECTURES
- SYSTEMS FOR THE FUTURE: TECHNOLOGY OR SYSTEM DRIVEN?

Featuring:

Bob Cooper
Former Director of DARPA

Edith Martin
Former Undersecretary of Defense

Col. Will Stackhouse
Pentagon Asst. for High Leverage Tech
Secretary of the Air Force for Acquisitions

Henry Lum
Chief of Information Sciences, NASA/Ames

Harry Benz
NASA/Langley

Art Justice
NOSC

John Graniero
RADC

Lt. Col. Robert Simpson
DARPA

David Mizell
USC Info. Sciences Institute

Lt. Col. Patrick Sisson
WPAFB

WHEN!
September 20-22
1988

WHERE!
Los Angeles Hilton Hotel
5711 West Century Blvd.
Los Angeles, CA

NORM DE NARDI ENTERPRISES
289 So. San Antonio Rd., Suite #204
Los Altos, CA 94022
(415) 941-8440

Attendance to exhibition is free!

- ☐ Please send me an invitation.
- ☐ I am interested in exhibiting, please send more info.
- ☐ I would like to take advantage of the \$395 pre-registration conference price, check enclosed.

NASA Tech Briefs Reprints

Make attractive sales presentations for your sales people at meetings and shows.

The reprints are printed in color or black and white on quality coated paper. Reprints can be ordered as one page or in multi-pages. The NTB cover with a message streamer may appear as page one with the editorial appearing on pages 2, 3, and 4 or your own message may be reprinted on page 4.

Call the NTB Production Department to customize a reprint for you at (212) 490-3999. Or write to NASA Tech Briefs, 41 East 42nd Street, New York, NY 10017.

12,000+ Solutions

25 YEARS OF NASA RESEARCH TECHNOLOGY AT YOUR FINGERTIPS

In minutes you can search 25 years of NASA Tech Briefs to find briefs related to your current project. NASA may have already found a solution or developed technology that may suggest other ways of resolving your problem. On the way to space NASA has had to solve

thousands of unique problems in all engineering fields; electronics, mechanics, materials, fabrication, physical sciences, mathematics and information sciences etc., under the most extreme conditions. Now with NTB:BASE you can examine over 12,000 briefs.

● **NTB:BASE**, a PC-compatible database. Can be used on an IBM PC/XT/AT or any IBM compatible equipped with: 256k-available memory or more; DOS 2.0 or higher; one double sided disk drive.

● **NTB:BASE** enables you to initiate a search by Subject Title, Author, Tech Brief Number or by Key Word or Phrase. You can review the abstract on your computer. The year in which the brief was published will be displayed with the abstract. You may order complete briefs for as little as \$2.00 each.

● **NTB:BASE** offers 6 categories. They are **Electronics, Physical Sciences, Mechanics, Materials, Fabrication Technology** and **3-IN-1**, which includes Mathematics & Information Sciences; Life Sciences; and Pre-1976 Computer Programs. Each category subscription costs only \$100.00, or subscribe to all 6 for only \$500.00. Annual updates are \$20.00 per category. All 6 for \$100.00.

● **NTB:BASE** is transferable to hard disk drive for faster access and convenience. Handy User Guide comes with complete instructions.

Enclosed please find check for \$_____ covering the selected categories ☐, or all categories ☐. Format: ☐ 360K ☐ 1.2M

- ☐ **A Electronics** Send me more
☐ **B Physical Sciences** information ☐
☐ **C Mechanics**
☐ **D Materials**
☐ **E Fabrication Technology**
☐ **F 3-In-1 (Mathematics & Information Sciences, Life Sciences and Computer Programs)**

ROTOCON

HIGH PERFORMANCE ROTARY CONTACTS

**THERMOCOUPLES,
RTD's, LVDT's
STRAIN GAUGES,
1 to 100 contacts!**

Unlike conventional slipring designs, the unique ROTOCON Sealed Mercury Rotary Contacts are low noise, low resistance, zero maintenance links between stationary and rotating components.

- Zero Electrical Noise
- Low And Stable Resistance
- Compact Size
- Zero Maintenance
- Environmentally Sealed
- Rugged And Reliable
- Unaffected By Vibration
- Mount In Any Orientation

A variety of standard and custom ROTOCON models are available to fit your mounting configuration, rotation speed, and current requirements (up to 2000 Amps!).

Call:

1 micro INCH

NON-CONTACT

GAGING

for less than \$5,000!!

Pioneer's PDG 500 PROXIMITY GAGE offers unparalleled accuracy and *sub-microinch resolution* for measuring displacement on a wide variety of fixed or moving surfaces. The PDG 500 is extensively used in the precision machine tool, semiconductor and disk drive industries, and has become *the* standard by which all others are judged.

- Wide Range — ± 10 inches to ± 10 mils
- High Resolution — better than 0.2 μ inch
- High Accuracy — 0.2% of Full Scale
- High Linearity — 0.1% of Full Scale
- Ultra-low Noise — less than 0.05 μ inch
- Wide Bandwidth — up to 40 KHz
- Analog Outputs for external processing
- Large Standoff Distances — 2 to 100 mils, depending on probe and application
- Wide Variety of Standard and Custom Probes to suit almost any requirement

TYPICAL APPLICATIONS

- FLATNESS and THICKNESS
- SURFACE IRREGULARITIES
- DIAMETER VARIATIONS
- BEARING/SPINDLE RUNOUT
- PRECISION ALIGNMENT
- CLOSED-LOOP POSITIONING
- MECHANICAL CALIBRATION
- COATING THICKNESS

COLD OR HOT EASY STARTS WITH TUFOIL

Hot weather . . . When you shut your engine down on a hot summer day, particularly after a Turnpike run, it's often hard to start. Hot parts expand and pinch together. TUFOIL's super low friction helps you get going easier. Cold weather puts a big strain on your battery and starting motor. Recent Canadian government and independent tests in Michigan verify improvements when TUFOIL is used. Cranking speed for gas engines improved 6.1% . . . diesels 9.6% . . . and a 5% fuel savings too. Six U.S. patents so far! Make winter and summer driving and starting easier.

Use TUFOIL . . . your engines will run better, last longer!

TUFOIL for Engines™
TUFOIL Lubit-8™
TUFOIL Gun-Coat™
TUFOIL Compu-Lube™
TUFOIL Lightning Grease™

But that's only part of the story! Recent tests by a major Federal Government Lab show a surface friction of .029 for their steel on steel 4-ball test using TUFOIL (teflon on teflon is .04). Confirmation is coming in from all over the world. OEMs specify TUFOIL products for astonishing improvements in performance in all types of machines.

TUFOIL is the "transistor of lubrication"™ . . . no other lubricant even comes close.

This box contains the world's finest motorized linear positioner. And the test results to prove it.

At Klinger, we go to an incredible amount of trouble to eliminate any eccentricity errors in the motion of our motorized linear stages. In fact, you might think we're a bit excessive, or eccentric, ourselves.

For example, we insist that every Klinger motorized stage be thoroughly tested and calibrated before shipment. These tests can take more than an hour each time.

We test under computer control using a laser interferometric system. Then we print the test results and pack them in the box with every linear stage. We'd like the proud owner of one of our stages to appreciate what a special product he holds in his hands.

We know of no other manufacturer who goes to so much trouble and expense to test their products' precision. Perhaps that's because no other manufacturer goes as far as Klinger to make their products so precise in the first place.

MAKING PERFECT LEAD SCREWS.

The incredible accuracy of a Klinger motorized linear stage begins with the lead screw drive system.

Unlike other companies, Klinger manufactures its own lead screws. We begin with heat-treated steel and diamond correct the threads so the profile and pitch – the distance of travel per screw revolution – approach perfection. This not only insures accuracy, it reduces wear and backlash. Our unique drive nut is matched to the screw and incorporates an ingenious design for uncou-

pling any remaining eccentricity in the screw from the moving carriage, reducing wear and improving long-term performance.

KLINGER PRECISION HAS NEVER BEEN SO AFFORDABLE.

Because Klinger engineers and technicians have gone to so much trouble in the design and manufacturing processes, these linear stages will improve the accuracy of any extremely precise application. Including ultra-fast laser systems, optical breadboards, and laser machining of metals, ce-

ramics or semiconductors.

What's more, Klinger will modify any stage to operate in unusual environments. In high magnetic fields, we can use non-magnetic materials and treat surfaces to reduce reflections in laser laboratories. And our stages have demonstrated their accuracy and durability even at liquid Helium temperatures and in high vacuums.

We'll also provide adaptor plates for any Klinger product to accommodate either metric or English mounting holes.

Right now, Klinger products are priced more competitively than at any time in our company's history.

To learn more about the thousands of Klinger micropositioners and systems, send for our free micropositioning handbook. Write or call Klinger Scientific Corporation, 999 Stewart Avenue, Garden City, NY 11530. (516) 745-6800.

HEADGEAR THAT HOLDS EVERYTHING NEEDED TO TACKLE AIRCRAFT MAINTENANCE PROBLEMS.

Searching through the millions of instructions needed to maintain the many systems on today's advanced aircraft is no easy task. But McDonnell Douglas logistics specialists have found a way to store massive amounts of data on computers linked to a miniature TV mounted on a technician's helmet. Detailed instructions needed to get the job done are instantly available

as text, graphics or video at the touch of a button, leaving hands free to carry out the work. Engineers at McDonnell Douglas are giving America its money's worth with new data displays — not only for maintenance, but for spacecraft and aircraft mission management — that save time and improve performance.
